THE COMPANY BEHIND THE BRAND

BFE: EXPERIENCE AND EXPERTISE AT YOUR SERVICE

More than 50 years of experience, expertise and know how strengthen BFE's leadership in the production and commercialization of valves for oil and gas, mining industry, petrochemical, power generation and utilities. This solid and dynamic business strategy allows BFE to identify and provide solutions to meet specific needs, and aims to achieve complete customer satisfaction which today turns out to be of great value.

BONNEY FORGE: THE NAME YOU TRUST FOR FORGED STEEL VALVES

Bonney Forge's forged steel valves and piping components have led the way for over eighty years in state-of-the-art design and dependable performance. It is qualities like these, combined with a customer-driven culture, that maintains Bonney Forge's leadership position within the industry for exceeding customer expectations. Our goal is to make Bonney Forge your number one world-wide choice for forged valves.

OUR MISSION

To be, today and in the future, the recognized leader in our industry, marketing and manufacturing forged steel valves, cast steel valves, forged fittings, branch connections and other related products to satisfy our customer's expectations.

To be cost effective through Total Quality performance of these operations, and thus provide the resources required to support our commitment to improve our products, processes and customer service.

To be a law abiding corporate citizen respecting the rights of individuals, contributing to the needs of the community and conserving the state of the environment.

OUR CREED

- Continuously improving quality, processes and customer service.
- Eliminating delays, errors and defects in materials and workmanship.
- Providing customers with access to statistical evidence that quality is incorporated in our products and production processes.
- Requiring suppliers to provide statistical evidence of quality in products and process capabilities.
- Sharing with the organization the cost of poor quality in products and services.
- Driving out fear and bringing problems to light for all to see.
- Working together to address specific problems and establish goals and solutions as a team.
- Controlling manufacturing processes which determine the final cost and quality of our products.
- Removing barriers which stand between employees and their pride of workmanship, and implementing ongoing training, supervision and employee development programs.
- Good housekeeping, which reflects on the company, its operating philosophy and our people.

BFE is specialized in the production of industrial valves for use in oil & gas, chemical, petrochemical, power, onshore and offshore industries. BFE has two main division:

- Albano Sant'Alessandro - BG - Italy: The management sales and operative offices are located here, as well as the machining, assembly and final testing workshop for forged valves
- Bosisio Parini - LC - Italy: The main components for forged valves are forged and represent BFE's first basic factor of global quality, seeing that the entire manufacturing process is controlled and guaranteed by the Company Quality System.

Bonney Forge is an industry leader in marketing and manufacturing forged steel fittings and unions, branch connections, forged steel valves, cast steel valves and specialty products.

For more than a century, Bonney Forge has achieved manufacturing excellence through the detailed attention to customer's needs and producing consistently superior flow control products. Today, the Bonney Forge name is synonymous with quality that exceeds all industry standards.

WFI International, a Bonney Forge Company, is a leading manufacturer of ferrous and non-ferrous branch connection fittings, specialty flanges, and seamless fittings for use in piping systems and on pressure vessels. WFI and Bonney Forge are the world's leading manufacturers of integrally reinforced branch connection fittings.

Bonney Forge acquired RP&C Valve in 2004. RP&C traces its' origin back to 1878 with the Steam Boiler Appliance Company. RP&C products consist of Forged Steel Valves used in the chemical processing, pulp and paper, petroleum, power, and residential and commercial construction markets.

COMPANY BACKGROUND

BONNEY FORGE CORPORATION ACQUIRES BFE

Bonney Forge Corporation has expanded its global footprint in manufacturing industrial valves and fittings by completing the purchase of BFE. As one of the world's leading manufacturers of forged steel valves, cast steel valves, forged steel fittings, unions and branch connections, our commitment to excellence in producing the highest quality products makes this acquisition a significant alliance in the international market.

2013

SECURING OUR GLOBAL PRESENCE BY INVESTING IN OURSELVES.

ENHANCED APPROACHES TO ENVIRONMENTAL AND ECOLOGICAL MANAGEMENT

As well as guaranteeing maximum functionality, all valves made by B.F.E. S.p.A. fully comply with international and EU norms to reduce atmospheric pollution and leakage also under critical conditions such as high pressures, temperatures and the presence of aggressive products, etc.

2004

DYNAMISM, INNOVATION AND GROWTH

A significant year for B.F.E. S.p.A. Bonney Forge Valve Licensee as Acciaierie Valbruna di Vicenza, one of the world's largest steel companies, comes in as controlling shareholder.

The US-based Bonney Forge Corporation continues to maintain its position as a shareholder and licensor.

1996

BONNEY FORGE EUROPE BECOMES B.F.E. S.P.A.

In 1987 the current B.F.E. S.p.A. Bonney Forge Valve Licensee is created: the company was acquired from Bonney Forge Corporation; however the latter remains a shareholder and licensor.

1987

1966

BONNEY FORGE EUROPE IS FOUNDED

December 1966. Bonney Forge Europe S.p.A. is officially incorporated. The Firm continues to operate mainly in energy production and the petrochemical industry. In order to meet increasingly sophisticated and complex market demands, Bonney Forge Europe buys a production plant exclusively dedicated to forging.

FIRST DAYS, A PROMISE OF QUALITY AND COMMITMENT

Forged valves production first started as long ago as 1955 in a converted warehouse in Albano S. Alessandro

originally built as a barn. The production was the responsibility of four people but in just a few years there were thirty on the payroll - thanks to a policy of steadfast commitment and the winning of a series of important orders from Italy's fast growing chemical and petrochemical industries.

TAKING QUALITY TO THE NEXT LEVEL

ENGINEERING IN A QUALITY DRIVEN MARKET

Our extensive, uncompromising, company-wide quality control system carefully monitors our manufacturing processes to assure a product that performs to the highest industry standards.

Quality assurance procedures include 100% hydrostatic and pneumatic testing of all valves in full conformance to applicable API standards and industry codes.

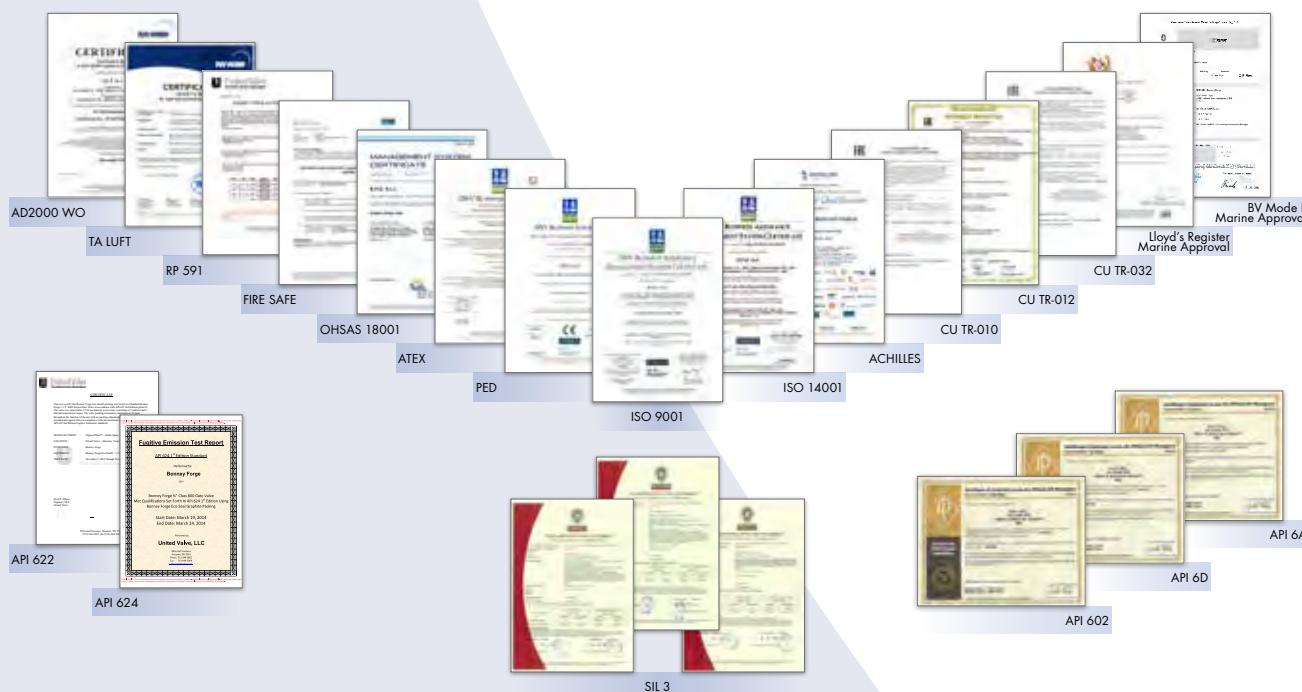

QUALITY THAT YOU CAN COUNT ON

BFE products are manufactured and tested in strict accordance to ASTM, ASME, ANSI, API and other applicable industry codes and specifications.

Chemical and mechanical properties of all Bonney Forge products are fully traceable to the original forging lot and raw material heat. Requirements of the market are in a state of constant evolution, and customers' quality needs are met and exceeded by the complete business process.

THE ASSURANCE YOU NEED

It is our policy to supply only quality products that conform fully to customer and statutory or regulatory requirements including codes and standards. To help meet our objective we operate an exacting quality control system, which has been audited and assessed by numerous customers and external authorities for compliance with all market standards.

CONFIDENCE IN STEEL FORGING

WHY FORGINGS?

Forging offers uniformity of composition and structure. Forging results in metallurgical recrystallisation and grain refinement as a result of the thermal cycle and deformation process.

This strengthens the resulting steel product particularly in terms of impact and shear strength. Forged steel is generally stronger and more reliable than castings and plate steel due to the fact that the grain flows of the steel are altered, conforming to the shape of the part.

WHAT YOU GAIN WHEN YOU SELECT OUR FORGINGS

- Dimensional uniformity and close dimensional tolerances.
- High Strength.
- Tougher than alternatives.
- Better response to heat treatment than alternatives.
- Will handle impact better than alternatives.
- The nature of forging excludes the occurrence of porosity, shrinkage, cavities and cold pour issues.
- The tight grain structure of forgings making it mechanically strong.
- The tight grain structure offers great wear resistance.

IN-HOUSE FORGING PRODUCTION

Thanks to constant search of efficient solutions the plant has the most modern forging production built on basis of semi-automatic and continuous forging line. High quality of forging is provided by the modern production accessories of the plant and usage of software for modeling the process of forging.

HIGHEST POSSIBLE MATERIAL QUALITY

BFE uses only high-quality materials inspected & tested to International Standards and utilizes advanced manufacturing technology with special emphasis on safety, quality, and long service life of our products, to ensure that our clients receive the "best in class" products available from us at a competitive price and delivered on time.

CHALLENGING MATERIALS FOR THE MOST CRITICAL APPLICATIONS

Forging material has increased strength under maximum rated operation pressure compared with cast. Other forging properties include greater impact resistance, resistance to fatigue cracking, particularly when cycling at either high or cryogenic temperature.

UNIQUE EXPERTISE FOR VALVE ENGINEERING

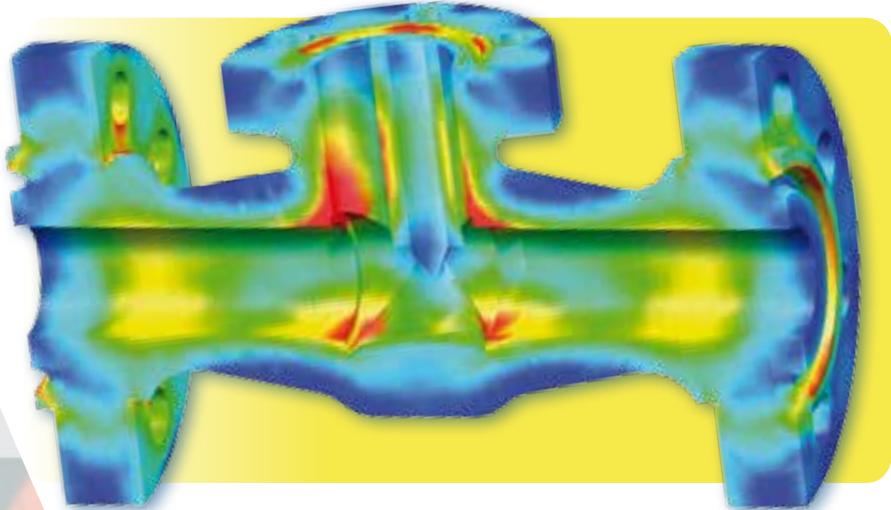

BFE offers extensive expertise in the design that provide the advantage of sophisticated product development with fast and cost-effective manufacturing capabilities.

Our approach ensures that you receive the lowest cost, and highest efficiency solution with a quick turn-around.

Bonney Forge represent decades of design experience across all market sectors. Using the latest software and design technologies, our Engineering can take your requirements and develop a specific custom solution.

BFE Engineering Department operates state of the art design tools with last generation solid modeling, linear and non linear finite element analysis and computational fluid dynamic analysis.

FMEA and FMECA tools are used to minimize the development risks and increase product reliability during the development of new products.

PRODUCTION CAPABILITIES THAT MEET YOUR DEMANDS

BFE is an integrated supplier with in-house forging, machining and assembly-test operations.

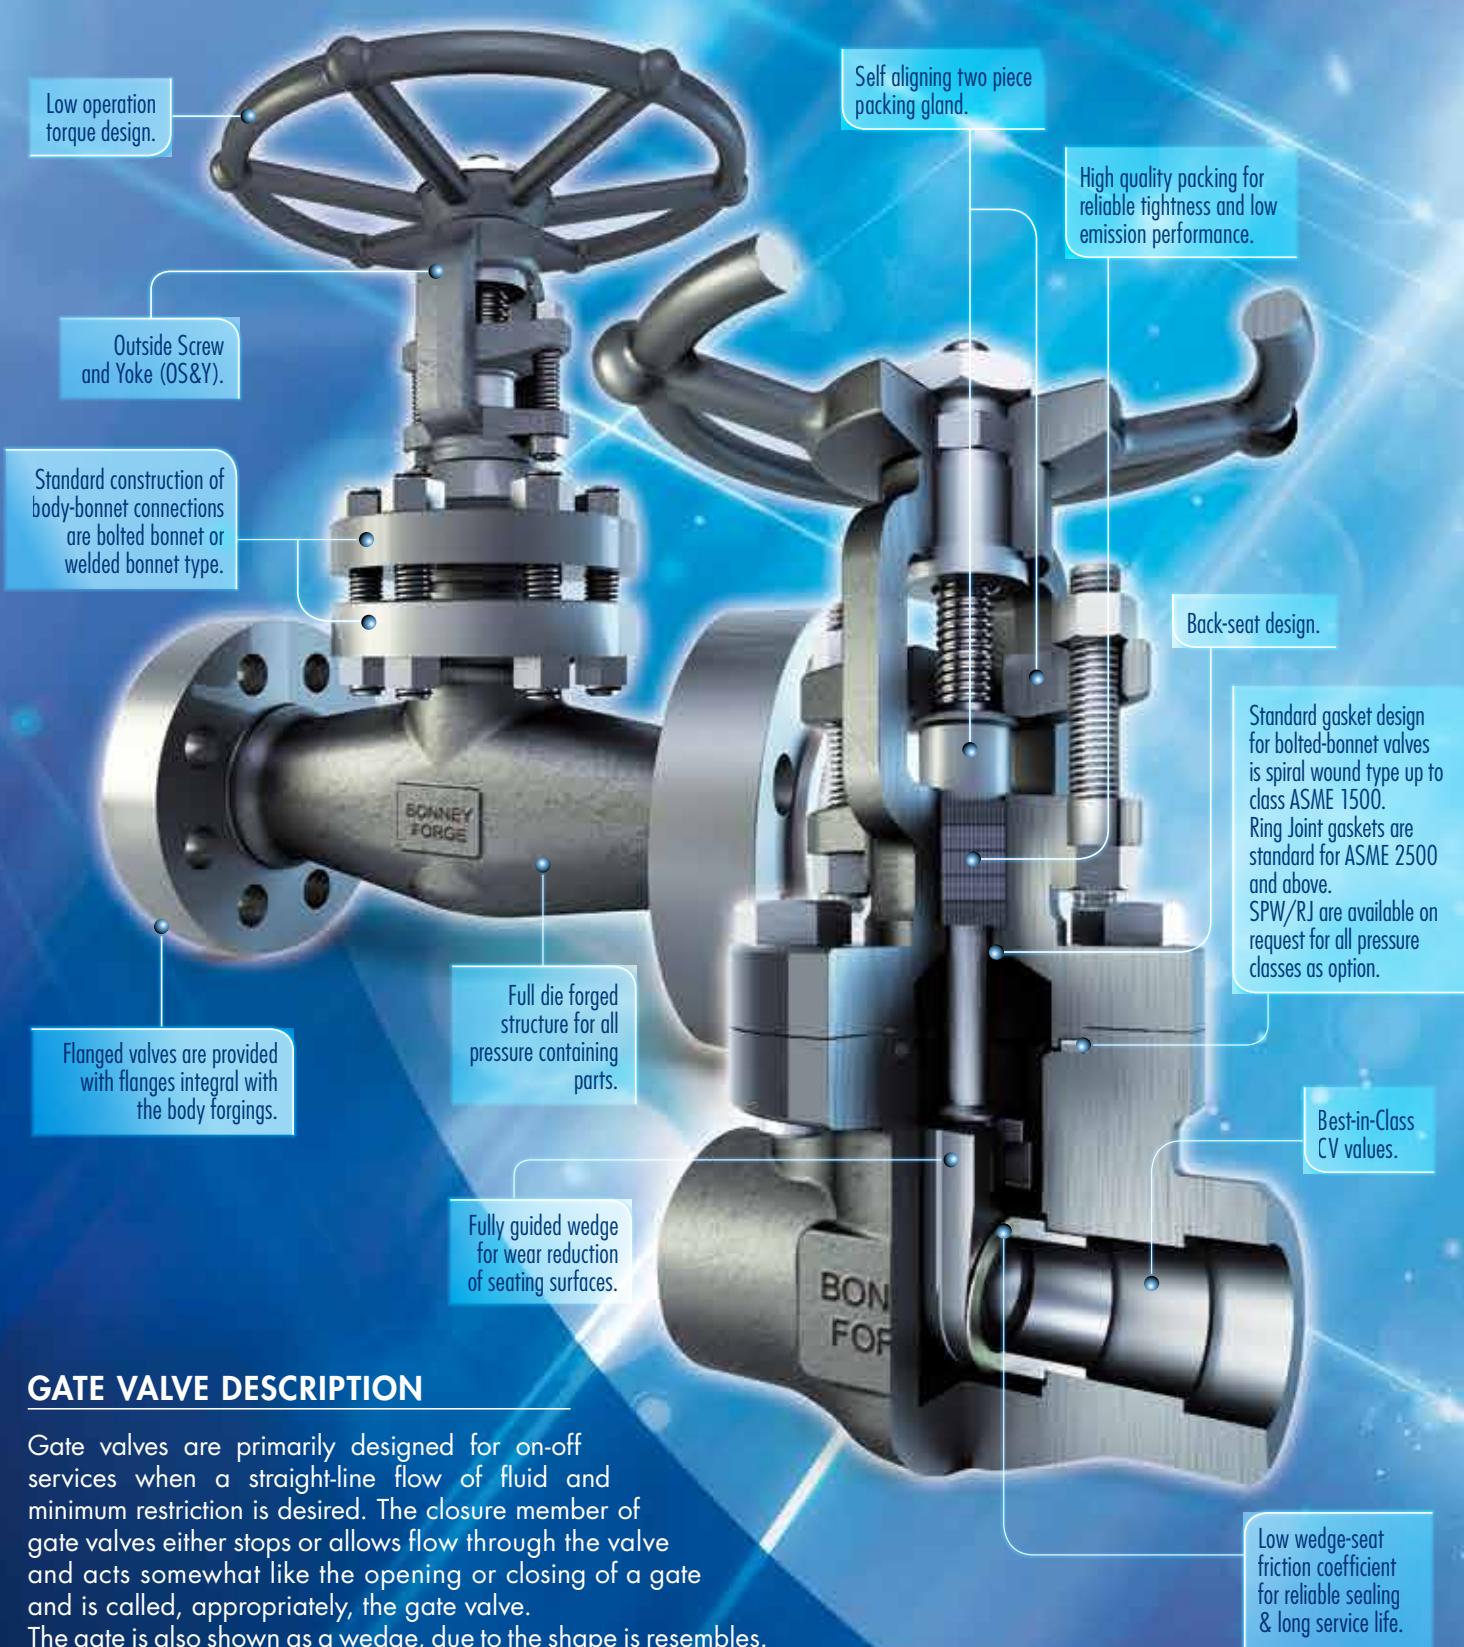

Continuous investment in computerized systems and integrated machining centres ensure the highest level of component repeatability, high volume capabilities with uncompromising quality.

BFE experience in managing the complete production process for complex and highly variable requirements benefits our customers by achieving a high rate of on-time delivery and the ability to meet some of the most demanding fast track shipments.

Combined with unlimited local qualified third party capabilities,

BFE production system is constantly expanding to handle steady growth rates and complex customer requirements.

GATE VALVES

GATE VALVE DESCRIPTION

Gate valves are primarily designed for on-off services when a straight-line flow of fluid and minimum restriction is desired. The closure member of gate valves either stops or allows flow through the valve and acts somewhat like the opening or closing of a gate and is called, appropriately, the gate valve.

The gate is also shown as a wedge, due to the shape it resembles. When the valve is open, the closure member is fully drawn up into the valve, leaving a complete opening for the flow stream. Therefore, there is little pressure drop or flow restriction through the valve. Gate valves are used in many industrial applications including the oil and gas industry, pharmaceuticals, manufacturing, automotive, and marine. Gate valves are not suitable for throttling purposes.

BFE reserves the right to change designs, dimensions or specifications without notice.

PRODUCT FEATURES:

- Socket Weld acc.to ASME B16.11. • Screwed ends (NPT) acc.to ASME B1.20.1. • Butt welding ends acc.to ASME B16.25. • End to End acc.to manufacturer standard. • Zero emission. • Hydroformed Bellows
- Extension-Bonnet weld acc.to ASME IX. • Grease nipple for yoke sleeve. • Emergency stuffing box as back sealing.

BFE reserves the right to change designs, dimensions or specifications without notice.

PRODUCT FEATURES:

- Socket Weld acc.to ASME B16.11.
- Screwed ends (NPT) acc.to ASME B1.20.1.
- Butt welding ends acc.to ASME B16.25.
- End to End acc.to manufacturer standard.
- Cryogenic design acc.to BS 6364.
- Body-Bonnet weld acc. to ASME IX.
- Body Cavity Vent Hole.

DESIGN TYPE E3

INTEGRAL REINFORCED EXTENDED BODY V-GROOVE SEAL WELD BODY-BONNET

DESIGN TYPE E4

EXTENDED BODY V-GROOVE SEAL WELD BODY-BONNET CONNECTION

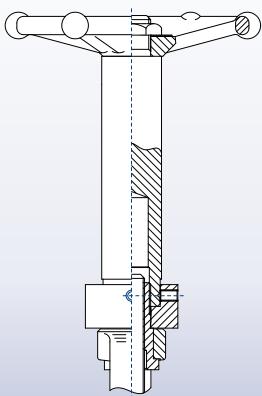

GATE VALVES

AVAILABLE OPTIONS FOR GATE VALVES

OTHER VALVE OPTIONS OR CUSTOMIZED VERSIONS ARE AVAILABLE ON REQUEST, CONTACT BFE FOR SPECIAL REQUIREMENTS.

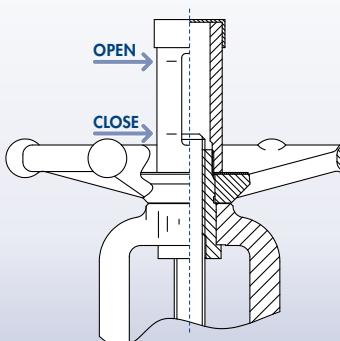

STEM EXTENSION

Valve handle can be extended to allow for panel mount and pipe insulation.

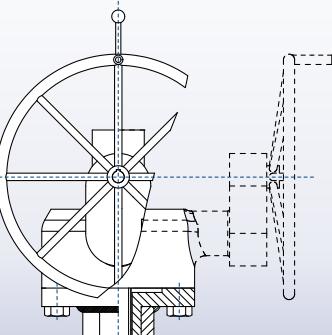

POSITION INDICATOR

Valves can be supplied with standard visual-mechanical indicating device that also acts as stem cover.

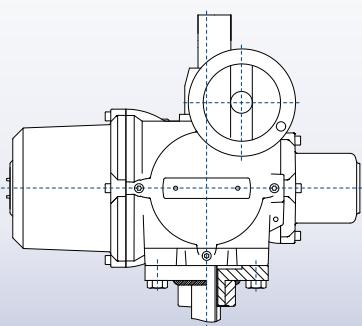

BEVEL GEAR ACTUATORS

Gearing can be applied to valves instead of the standard handwheel to make operation easier.

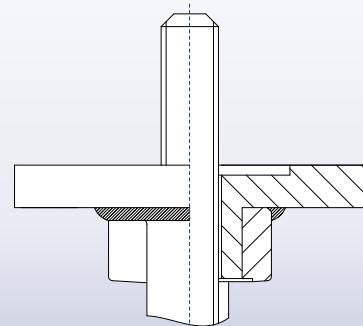

ELECTRIC, PNEUMATIC OR HYDRAULIC ACTUATORS

Motorized controls may be applied to valves of any size for operation in any position or location.

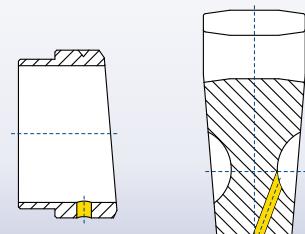

ACTUATOR-READY

Valves can be supplied ready for actuation without the handwheel or gear lower case "S". The mounting connection can be BFE Standard or can suit the choice or type of actuator.

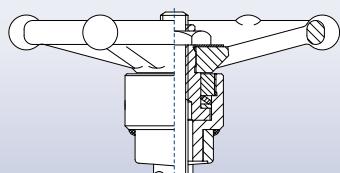

OVERPRESSURE DEVICE

Cavity over-pressurization protection can be supplied. BFE standard option is a hole performed on the seat, if required the same hole can be performed on the closure member.

THERMAL EXPANSION STEM COMPENSATOR

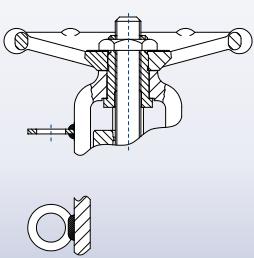

Valves which endure large thermal transients have the basic problem that the valve stem and closure member will expand and contract with the danger that a closed valve could become jammed in its seat and in extreme cases this can cause the valve stem to distort. High Temperature Valve configuration is equipped with a spring loaded stem sleeve that will absorb any expansion or contraction caused by temperature fluctuations without affecting the position of the closed valve stem.

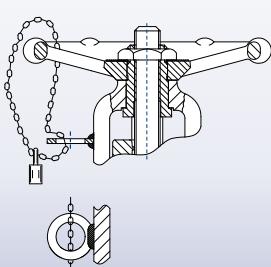

LOCKING DEVICE

Locking devices designed to help prevent accidental or unwanted operation are built to resist excessive force. All BFE locking device options are simple but secure. Chain and Padlock available on request.

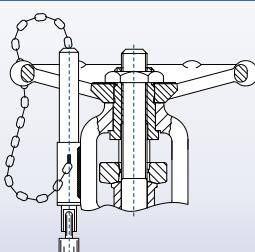

LOCKING FACILITY

LOCKING FACILITY WITH C&P

LOCKING DEVICE

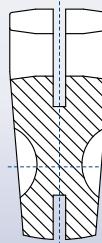

AVAILABLE OPTIONS FOR GATE VALVES

OTHER VALVE OPTIONS OR CUSTOMIZED VERSIONS ARE AVAILABLE ON REQUEST, CONTACT BFE FOR SPECIAL REQUIREMENTS.

CLOSURE MEMBER TYPE OTHER THAN SOLID WEDGE

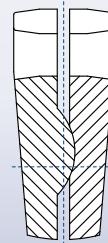

The flex wedge

is a one piece, fully guided cast wedge with a central hub to allow the seating faces to move relative to each other thus compensating for distortion of the body seats due to thermal expansion or piping loads.

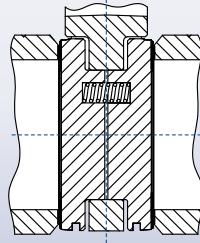

The split wedge

is self-adjusting to both seal sides and consists of two-piece construction. This type of wedge is suitable for the treatment of non-condensing gases and liquids at normal temperatures, particularly corrosive liquids.

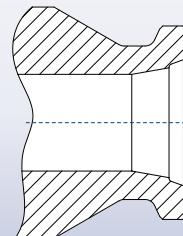

Parallel seat gate

and seat ring construction can be furnished for high differential pressure services where stem low torque is required or where high piping loads or thermal expansion may cause sticking of a wedge type gate. Spring-loaded discs are self-aligning and reduces actuator torque requirements.

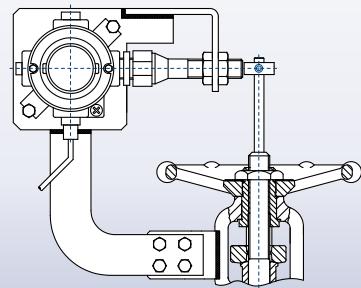

SPECIAL END FINISH

The choice of end connections for connecting a valve to its associated pipe is performed by customers. Common end finish stated in the catalogue are socket, threaded, flanged (RF or RJ) and butt-weld ends. BFE is basically able to perform any end finish as required by the customers and other end finish as follows: hub, compact flange, any ASME B16.5 end finish other than RF and RJ, etc.

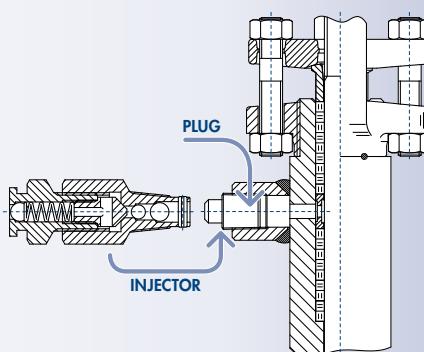

LIMIT SWITCH ASSEMBLIES

Position Limit Switch assemblies enables a remote signaling of the control system the opening of the valve. It can be equipped with one or two switches actuated by closing or opening of the valve. Limit switch can be selected by customer, bracket is designed by BFE.

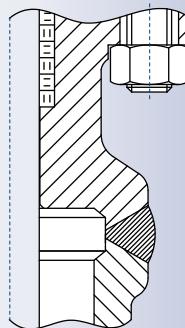

STEM DOUBLE SEAL

Stem double seals are fitted to valves when hazardous fluids are handled or when external lubrication is used. The most usual form of double seal is two sets of packing, the lantern ring can provide extra stem guidance. BFE can supply the lantern ring version with standard plug or with injector (double ball check type). Other special configurations are available on request.

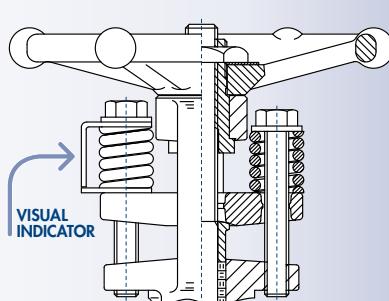

BODY-BONNET FULL PENETRATION WELD

BFE standard welded bonnet valves have as standard a seal weld on the body-bonnet connection. Seal weld is a weld that does not contribute anything to the mechanical integrity of an assembly, but is made purely to seal or prevent leakage from, for instance, a threaded joint. When High-End quality is required for body-bonnet weld joint a weld with full penetration can be performed. Full penetration weld is one in which there is a complete penetration and fusion of weld and parent metal throughout the thickness of the joint. A full penetration weld ensures a fully welded interface between the two parts and is generally the strongest joint.

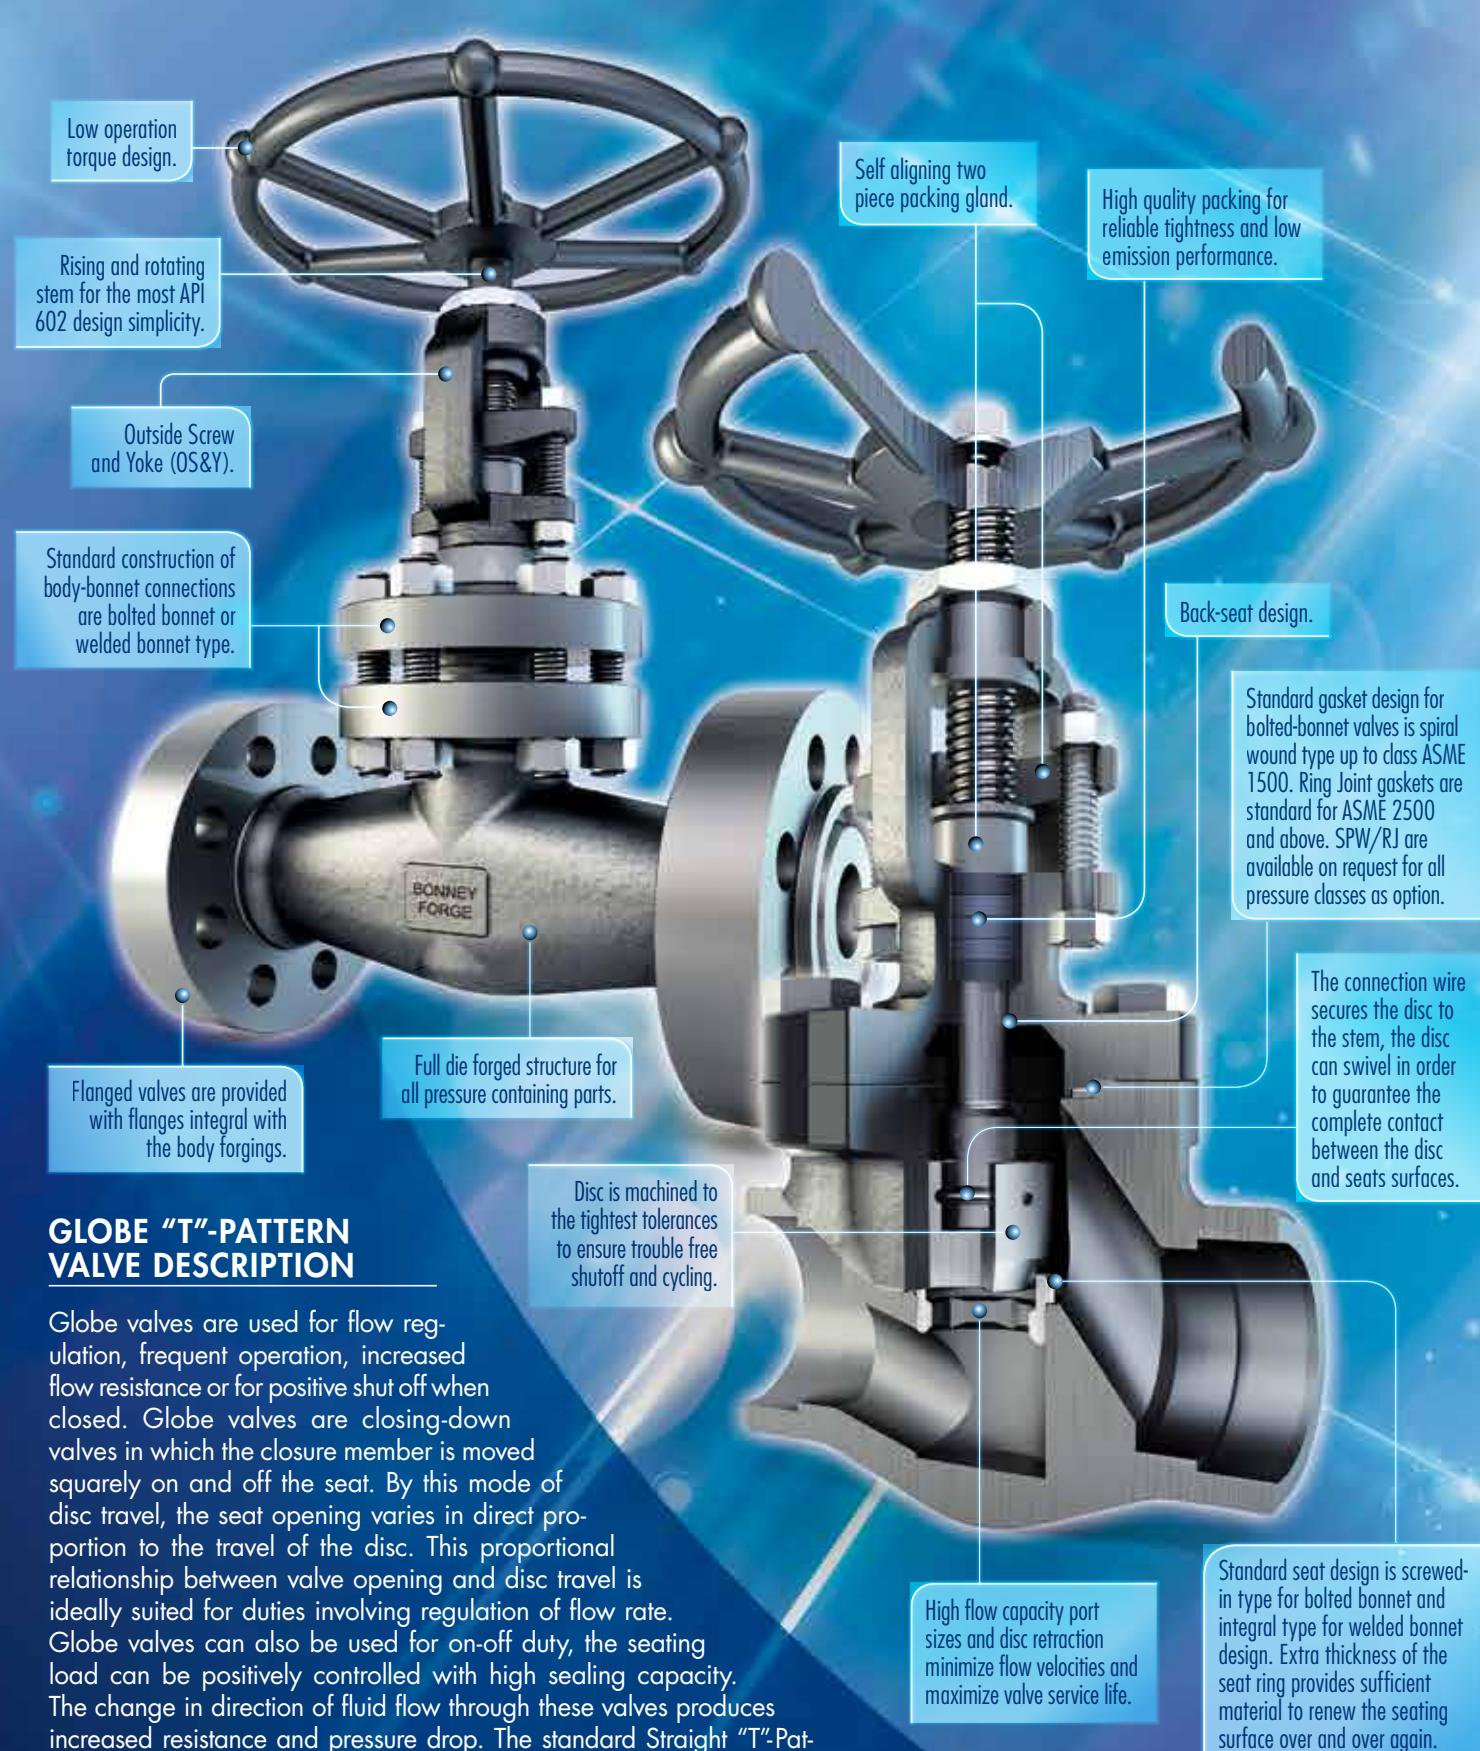

LIVE LOADING

Live Loading System consists of a spring system installed on packing stud to warrant a continuous load on valve packing. Spring are specially designed to allow appropriate load in case of packing settling by minimizing initial load and friction. Mechanical visual indicator of the spring compression is included.

"T"-PATTERN GLOBE VALVES

GLOBE "T"-PATTERN VALVE DESCRIPTION

Globe valves are used for flow regulation, frequent operation, increased flow resistance or for positive shut off when closed. Globe valves are closing-down valves in which the closure member is moved squarely on and off the seat. By this mode of disc travel, the seat opening varies in direct proportion to the travel of the disc. This proportional relationship between valve opening and disc travel is ideally suited for duties involving regulation of flow rate. Globe valves can also be used for on-off duty, the seating load can be positively controlled with high sealing capacity. The change in direction of fluid flow through these valves produces increased resistance and pressure drop. The standard Straight "T"-Pattern valve body is the most common, but because of its tortuous flow passage it offers the highest resistance to flow of the patterns available. Globe valves are used in many industrial applications including the oil and gas industry, pharmaceutical, manufacturing, automotive, and marine. Globe valves are also recommended for services requiring frequent operation and positive shut off.

PRODUCT FEATURES:

- Socket Weld acc.to ASME B16.11.
- Screwed ends (NPT) acc.to ASME B1.20.1.
- Butt welding ends acc.to ASME B16.25.
- End to End acc.to manufacturer standard.
- Cryogenic design acc.to BS 6364.

BFE reserves the right to change designs, dimensions or specifications without notice.

PRODUCT FEATURES:

- Flanged ends acc.to ASME B16.5.
- Face to Face acc.to ASME B16.10.
- Cryogenic design acc.to BS 6364.

BFT reserves the right to change designs, dimensions or specifications without notice.

PRODUCT FEATURES:

- Socket Weld acc.to ASME B16.11. • Screwed ends (NPT) acc.to ASME B1.20.1. • Butt welding ends acc.to ASME B16.25. • End to End acc.to manufacturer standard. • Zero emission. • Hydroformed Bellows
- Extension-Bonnet weld acc.to ASME IX. • Grease nipple for yoke sleeve. • Emergency stuffing box as back sealing.

BFT reserves the right to change designs, dimensions or specifications without notice.

PRODUCT FEATURES:

- Socket Weld acc.to ASME B16.11.
- Screwed ends (NPT) acc.to ASME B1.20.1.
- Butt welding ends acc.to ASME B16.25.
- End to End acc.to manufacturer standard.
- Body-Bonnet weld acc.to ASME IX.

BFF reserves the right to change designs, dimensions or specifications without notice.

PRODUCT FEATURES:

- Socket Weld acc.to ASME B16.11.
- Screwed ends (NPT) acc.to ASME B1.20.1.
- Butt welding ends acc.to ASME B16.25.
- End to End acc.to manufacturer standard.
- Zero emission.
- Hydroformed Bellows
- Welds acc.to ASME IX.
- Grease nipple for yoke sleeve.
- Emergency stuffing box as back sealing.

BFE reserves the right to change designs, dimensions or specifications without notice.

FULL BORE

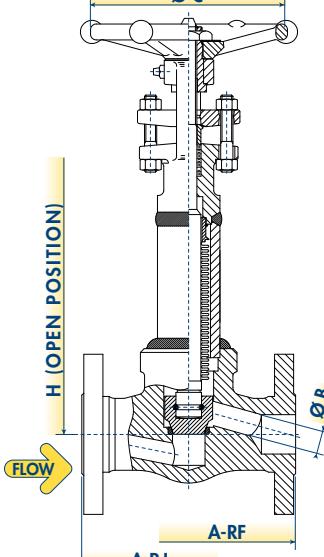

BFE reserves the right to change designs, dimensions or specifications without notice.

PRODUCT FEATURES:

- Flanged ends acc.to ASME B16.5. • Face to Face acc.to ASME B16.10. • Zero emission. • Hydroformed Bellows. • Welds acc.to ASME IX. • Grease nipple for yoke sleeve. • Emergency stuffing box as back sealing.

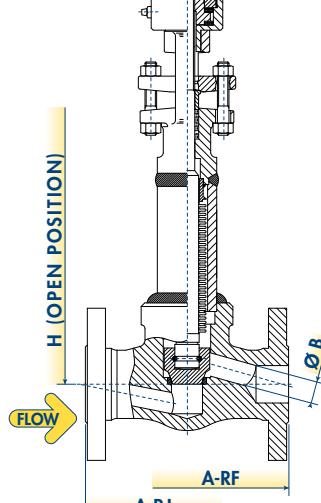

DESIGN TYPE P1

HANDWHEEL OPERATED

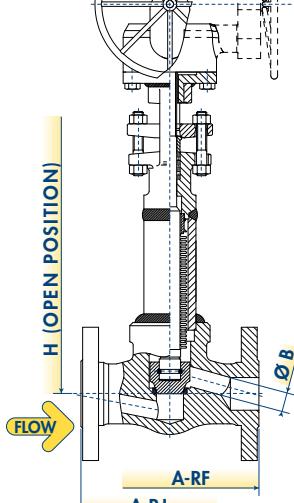

DESIGN TYPE P2

HANDWHEEL OPERATED WITH THRUST BEARINGS

DESIGN TYPE P3

GEAR OPERATED

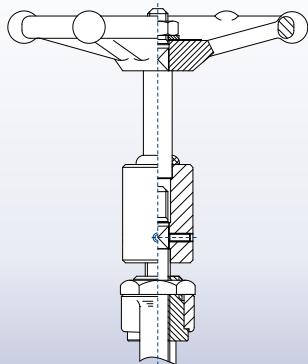

"T"-PATTERN GLOBE VALVES

AVAILABLE OPTIONS FOR "T"-PATTERN GLOBE VALVES

OTHER VALVE OPTIONS OR CUSTOMISED VERSIONS ARE AVAILABLE ON REQUEST, CONTACT BFE FOR SPECIAL REQUIREMENTS.

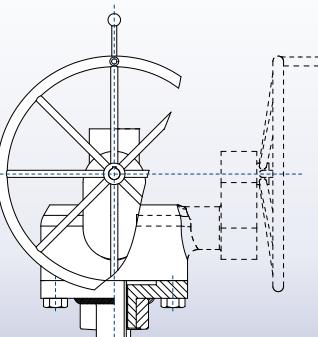

STEM EXTENSION

Valve handle can be extended to allow for panel mount and pipe insulation.

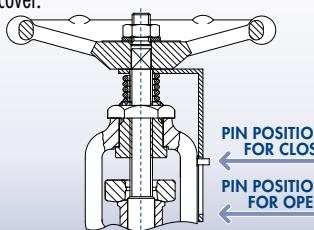

BEVEL GEAR ACTUATORS

Gearing can be applied to valves instead of the standard handwheel to make operation easier.

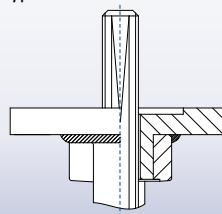

POSITION INDICATOR

Valves can be supplied with standard visual-mechanical indicating device that also acts as stem cover.

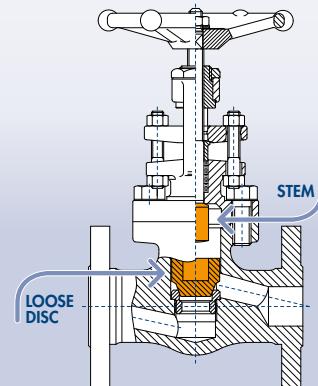

ACTUATOR-READY

Valves can be supplied ready for actuation without the handwheel or gear lower case "S". The mounting connection can be BFE Standard or can suit the choice or type of actuator.

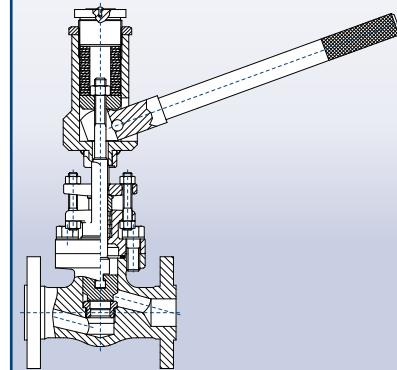

STOP CHECK

Globe valves with stop check option have a guided loose disc allowing the valve to act as a combination globe and check valve. There is the manual control to regulate the opening and closing, and can be completely stopped or shut off. This type of valve will generally be used as a globe valve to start or stop the flow of the media, but will automatically close should pressure be lost in the line, preventing backflow.

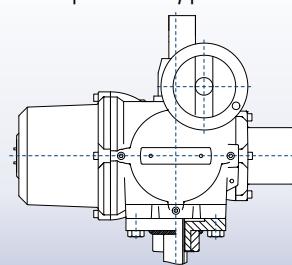

DEAD MAN OPERATOR

Dead Man Handle automatically closes the valve when operator Releases Handle. This means the operator must hold the handle in the open position for the product to flow. The operator can't walk away or the valve will shut off. Locking handle option for our spring return deadman handle is available.

ELECTRIC, PNEUMATIC OR HYDRAULIC ACTUATORS

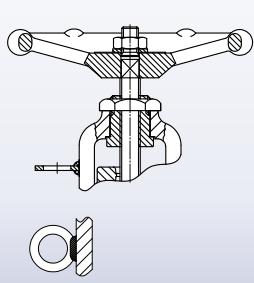

Motorized controls may be applied to valves of any size for operation in any position or location.

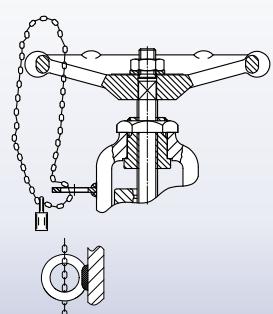

LOCKING DEVICE

Locking devices designed to help prevent accidental or unwanted operation are built to resist excessive force. All BFE locking device options are simple but secure. Chain and Padlock available on request.

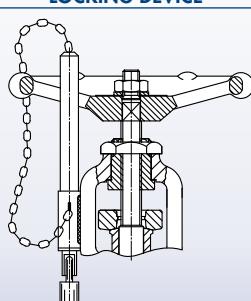

LOCKING FACILITY

LOCKING FACILITY WITH C&P

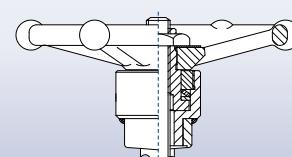

LOCKING DEVICE

THERMAL EXPANSION STEM COMPENSATOR

Valves which endure large thermal transients have the basic problem that the valve stem and closure member will expand and contract with the danger that a closed valve could become jammed in its seat and in extreme cases this can cause the valve stem to distort. High Temperature Valve configuration is equipped with a spring loaded stem sleeve that will absorb any expansion or contraction caused by temperature fluctuations without affecting the position of the closed valve stem.

"T"-PATTERN GLOBE VALVES

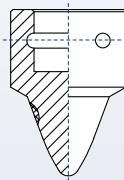

AVAILABLE OPTIONS FOR "T"-PATTERN GLOBE VALVES OTHER VALVE OPTIONS OR CUSTOMISED VERSIONS ARE AVAILABLE ON REQUEST, CONTACT BFE FOR SPECIAL REQUIREMENTS.

DISC AND TRIM TYPE

BFE standard plug is the has a quick opening characteristic, this plug provides maximum flow with minimum pressure drop and is ideal when large flows are required just after opening. All BFE standard plugs require a flow direction FTO type. BFE trim variations can offer maximum versatility in flow control application within the capability of globe valve design.

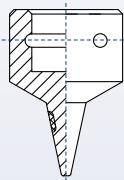

PARABOLIC DISC TRIM TYPE

Characteristic: Linear. This plug covers all Cv ranges and is especially suitable for low differential pressures.

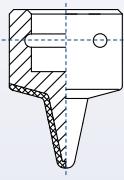

NEEDLE TRIM TYPE

Needle trim design is suitable for use where low valve CV values or low flows are required.

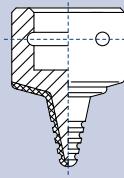

BLOW DOWN TRIM STANDARD TYPE

Blow Down trim design is suitable for use where high differential pressures are present. The high pressure drop causes erosion and cavitation which can destroy conventional globe valves.

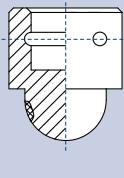

BLOW DOWN TRIM MULTI-STEP TYPE

Improved blow-down trim developed to provide a high number of pressure letdown steps to minimise the potential for excessive noise, cavitation, vibration and erosion. Multi-Step trim has been designed for all fluid combinations, both clean and dirty service. This range of trims is normally customized and designed on the customer design data.

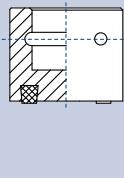

BALL DISC TRIM TYPE

The ball disc is used where the applications involve low pressure and low temperature systems. Though the ball disc can be used for throttling purpose, the efficiency might not be as expected.

SOFT SEATED PLUG

Soft seated trim provides improved seat tightness at low differential pressures. This design feature includes a plastic sealing member on the valve closure element to supplement the basic metal-to-metal seating function. The design and material selection for these sealing members are based on customer pressure, temperature and compatibility with the line fluid.

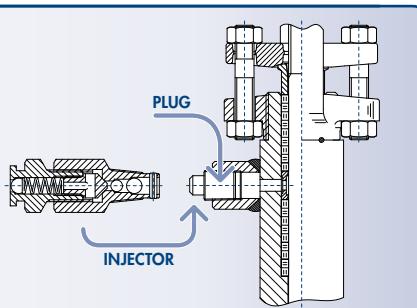

STEM DOUBLE SEAL

Stem double seals are fitted to valves when hazardous fluids are handled or when external lubrication is used.

The most usual form of double seal is two sets of packing, the lantern ring can provide extra stem guidance.

BFE can supply the lantern ring version with standard plug or with injector (double ball check type). Other special configurations are available on request.

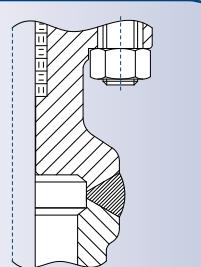

BODY-BONNET FULL PENETRATION WELD

BFE standard welded bonnet valves have as standard a seal weld on the body-bonnet connection. Seal weld is a weld that does not contribute anything to the mechanical integrity of an assembly, but is made purely to seal or prevent leakage from, for instance, a threaded joint. When High-End quality is required for body-bonnet weld joint a weld with full penetration can be performed.

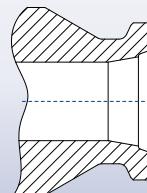

Full penetration weld is one in which there is a complete penetration and fusion of weld and parent metal throughout the thickness of the joint.

A full penetration weld ensures a fully welded interface between the two parts and is generally the strongest joint.

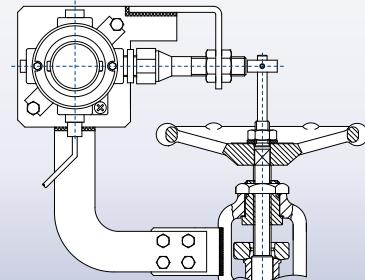

SPECIAL END FINISH

The choice of end connections for connecting a valve to its associated pipe is performed by customers. Common end finish stated in the catalogue are socket, threaded, flanged (RF or RJ) and butt-weld ends. BFE is basically able to perform any end finish as required by the customers and other end finish as follows: hub, compact flange, any ASME B16.5 end finish other than RF and RJ, etc.

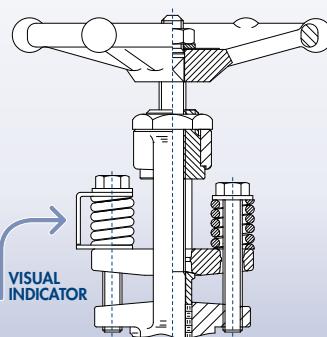

LIMIT SWITCH ASSEMBLIES

Position Limit Switch assemblies enables a remote signaling of the control system the opening of the valve. It can be equipped with one or two switches actuated by closing or opening of the valve. Limit switch can be selected by customer, bracket is designed by BFE.

LIVE LOADING

Live Loading System consists of a spring system installed on packing stud to warrant a continuous load on valve packing. Spring are specially designed to allow appropriate load in case of packing settling by minimizing initial load and friction. Mechanical visual indicator of the spring compression is included.

"Y"-PATTERN GLOBE VALVES

GLOBE "Y"-PATTERN VALVE DESCRIPTION

Globe valves are used for flow regulation, frequent operation, increased flow resistance or for positive shutoff when closed. Globe valves are closing-down valves in which the closure member is moved squarely on and off the seat. By this mode of disc travel, the seat opening varies in direct proportion to the travel of the disc. This proportional relationship between valve opening and disc travel is ideally suited for duties involving regulation of flow rate. Globe valves can also be used for on-off duty, the seating load can be positively controlled with high sealing capacity.

The change in direction of fluid flow through these valves produces increased resistance and pressure drop. The oblique pattern globe-valve body is designed to reduce the flow resistance of the valve to a minimum. This valve combines low flow resistance for on-off duty with the robustness of globe-valve seatings. Globe valves are used in many industrial applications including the oil and gas industry, pharmaceutical, manufacturing, automotive, and marine. Globe valves are also recommended for services requiring frequent operation and positive shutoff.

PRODUCT FEATURES:

- Outside Screw and Yoke (OS&Y).
 - Self aligning two piece packing gland.
 - Integral backseat.
 - Integral body flanges.
 - Bonnet Extension.
- NOTE 1: Face-to-Face acc. to ASME B16.10 related to class 300.

BE reserves the right to change designs, dimensions or specifications without notice.

FULL BORE

BF reserves the right to change designs, dimensions or specifications without notice.

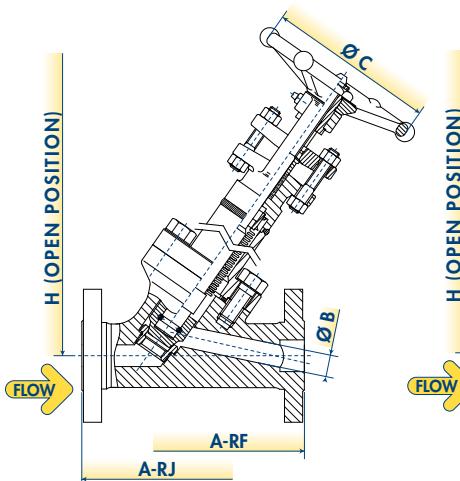

PRODUCT FEATURES:

- Outside Screw and Yoke (OS&Y).
- Self aligning two piece packing gland.
- Integral backseat.
- Integral body flanges.

NOTE 1: Face-to-Face acc. to ASME B16.10 related to class 300.

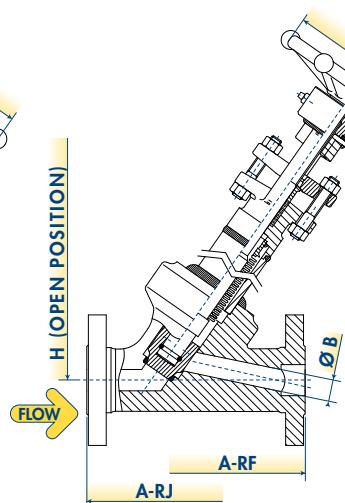

DESIGN TYPE P1

HANDWHEEL OPERATED

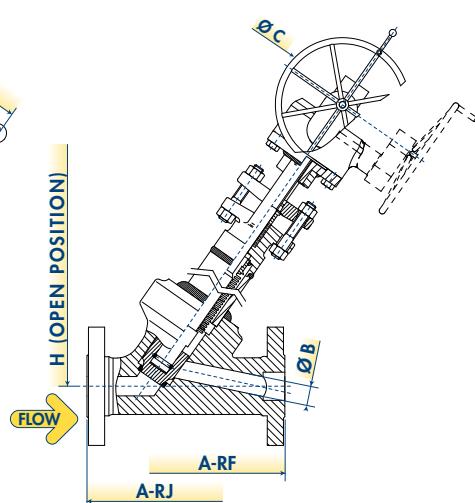

DESIGN TYPE P2

HANDWHEEL OPERATED WITH THRUST BEARINGS

DESIGN TYPE P3

GEAR OPERATED

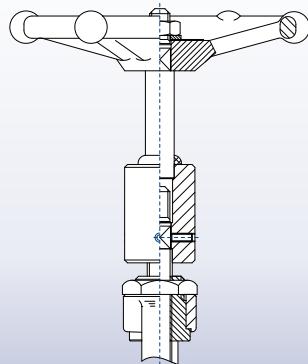

"Y"-PATTERN GLOBE VALVES

AVAILABLE OPTIONS FOR "Y"-PATTERN GLOBE VALVES

OTHER VALVE OPTIONS OR CUSTOMISED VERSIONS ARE AVAILABLE ON REQUEST, CONTACT BFE FOR SPECIAL REQUIREMENTS.

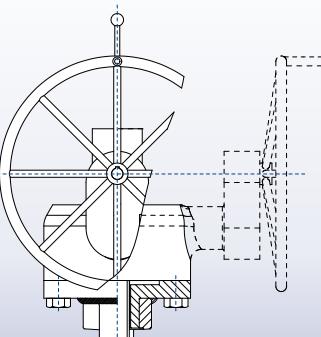

■ STEM EXTENSION

Valve handle can be extended to allow for panel mount and pipe insulation.

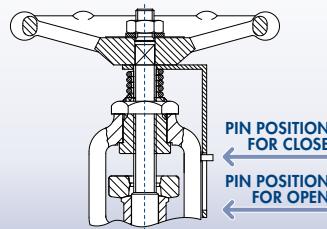

■ GEAR ACTUATORS

Gearing can be applied to valves instead the standard handwheel to make operation easier.

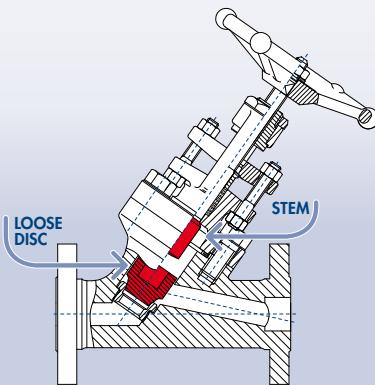

■ POSITION INDICATOR

Valves can be supplied with standard visual-mechanical indicating device that act as stem cover also.

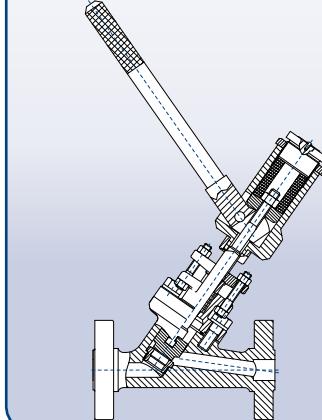

■ STOP CHECK

Globe valves with stop check option have a guided loose disc allowing the valve to act as a combination globe and check valve. There is the manual control to regulate the opening and closing, and can be completely stopped or shut off. This type of valve will generally be used as a globe valve to start or stop the flow of the media, but will automatically close should pressure be lost in the line, preventing backflow.

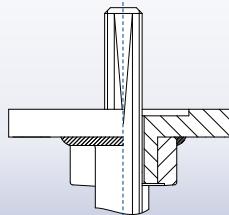

■ DEAD MAN OPERATOR

Dead Man Handle automatically closes the valve when operator Releases Handle. This means the operator must hold the handle in the open position for the product to flow. The operator can't walk away or the valve will shut off. Locking handle option for our spring return deadman handle is available.

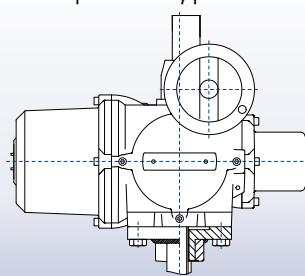

■ ACTUATOR-READY

Valves can be supplied ready for actuation without the handwheel or gear box. The mounting connection can be BFE Standard or can suit the choice or type of actuator.

■ ELECTRIC, PNEUMATIC OR HYDRAULIC ACTUATORS

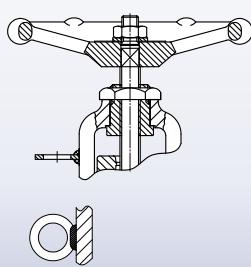

Motorized controls may be applied to valves of any size for operation in any position or location.

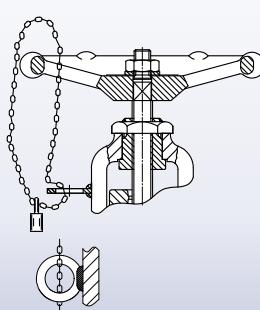

■ LOCKING DEVICE

Locking devices designed to help prevent accidental or unwanted operation by being built to resist excessive force or unusual abuse. All BFE locking device option are simple but secure. Chain and Padlock available on request.

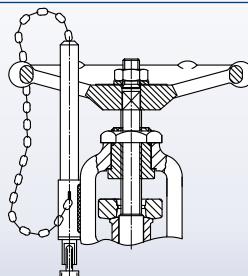

LOCKING FACILITY

LOCKING FACILITY WITH C&P

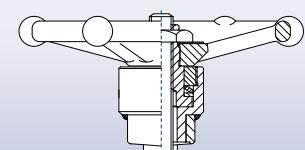

LOCKING DEVICE

■ THERMAL EXPANSION STEM COMPENSATOR

Valves which endure large thermal transients have the basic problem that the valve stem and closure member will expand and contract with the danger that a closed valve could become jammed in its seat and in extreme cases this can cause the valve stem to distort. High Temperature Valve configuration is equipped with a spring loaded stem sleeve that will absorb any expansion or contraction caused by temperature fluctuations without affecting the position of the closed valve stem.

"Y"-PATTERN GLOBE VALVES

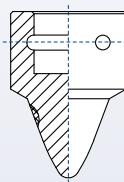

AVAILABLE OPTIONS FOR "Y"-PATTERN GLOBE VALVES OTHER VALVE OPTIONS OR CUSTOMISED VERSIONS ARE AVAILABLE ON REQUEST, CONTACT BFE FOR SPECIAL REQUIREMENTS.

DISC AND TRIM TYPE

BFE standard plug is the has a quick opening characteristic, this plug provides maximum flow with minimum pressure drop and is ideal when large flows are required just after opening. All BFE standard plugs require a flow direction FTO type. BFE trim variations can offer maximum versatility in flow control application within the capability of globe valve design.

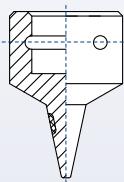

PARABOLIC DISC TRIM TYPE

Characteristic: Linear. This plug covers all Cv ranges and is especially suitable for low differential pressures.

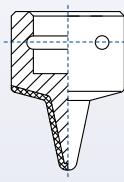

NEEDLE TRIM TYPE

Needle trim design is suitable for use where low valve CV values or low flows are required.

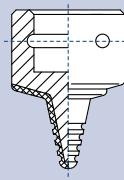

BLOW DOWN TRIM STANDARD TYPE

Blow Down trim design is suitable for use where high differential pressures are present. The high pressure drop causes erosion and cavitation which can destroy conventional globe valves.

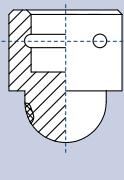

BLOW DOWN TRIM MULTI-STEP TYPE

Improved blow-down trim developed to provide a high number of pressure letdown steps to minimise the potential for excessive noise, cavitation, vibration and erosion. Multi-Step trim has been designed for all fluid combinations, both clean and dirty service. This range of trims is normally customized and designed on the customer design data.

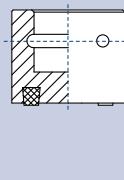

BALL DISC TRIM TYPE

The ball disc is used where the applications involve low pressure and low temperature systems. Though the ball disc can be used for throttling purpose, the efficiency might not be as expected.

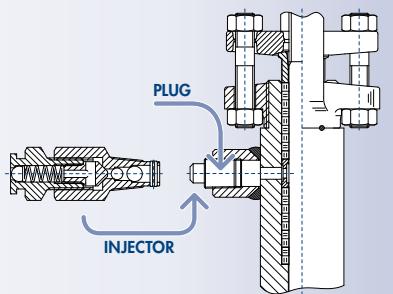

SOFT SEATED PLUG

Soft seated trim provides improved seat tightness at low differential pressures. This design feature includes a plastic sealing member on the valve closure element to supplement the basic metal-to-metal seating function. The design and material selection for these sealing members are based on customer pressure, temperature and compatibility with the line fluid.

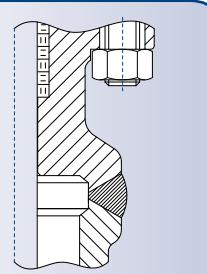

STEM DOUBLE SEAL

Stem double seal are fitted to valves when hazardous fluids are handled or when external lubrication is used. Valves operating under vacuum or with high temperature liquid may have a flowing liquid quench between the seals. The most usual form of double seal is two sets of packing, the lantern ring can provide extra stem guidance. BFE can supply the lantern ring version with standard plug or with injector (double ball check type). Other special configuration are available on request.

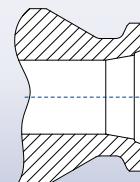

BODY-BONNET FULL PENETRATION WELD

BFE standard welded bonnet valves have as standard a seal weld on the body-bonnet connection. Seal weld is a weld that does not contribute anything to the mechanical integrity of an assembly, but is made purely to seal or prevent leakage from, for instance, a threaded joint. When High-End quality is required for body-bonnet weld joint a weld with full penetration can be performed. Full penetration weld is one in which there is a complete penetration and fusion of weld and parent metal throughout the thickness of the joint. A full penetration weld ensures a fully welded interface between the two parts and is generally the strongest joint.

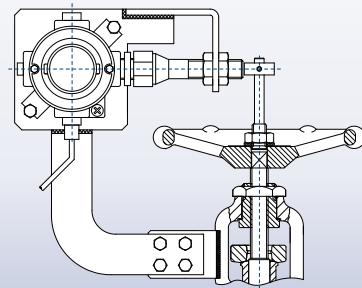

SPECIAL END FINISH

The choice of end connections for connecting a valve to its associated pipe is performed by customers. Common end finish stated in the catalogue are socket, threaded, flanged (RF or RJ) and butt-weld ends. BFE is basically able to perform any end finish as per customer request, special end finish Other end finish as follows: hub, compact flange, any ASME B16.5 end finish other than RF and RJ, etc.

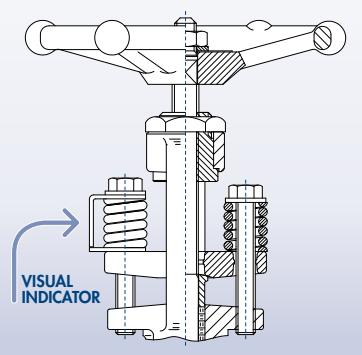

LIMIT SWITCH ASSEMBLIES

Position Limit Switch assemblies enables a remote signaling of the control system the opening of the valve. It can be equipped with one or two switches actuated by closing or opening of the valve. Limit switch can be selected by customer, bracket is designed by BFE.

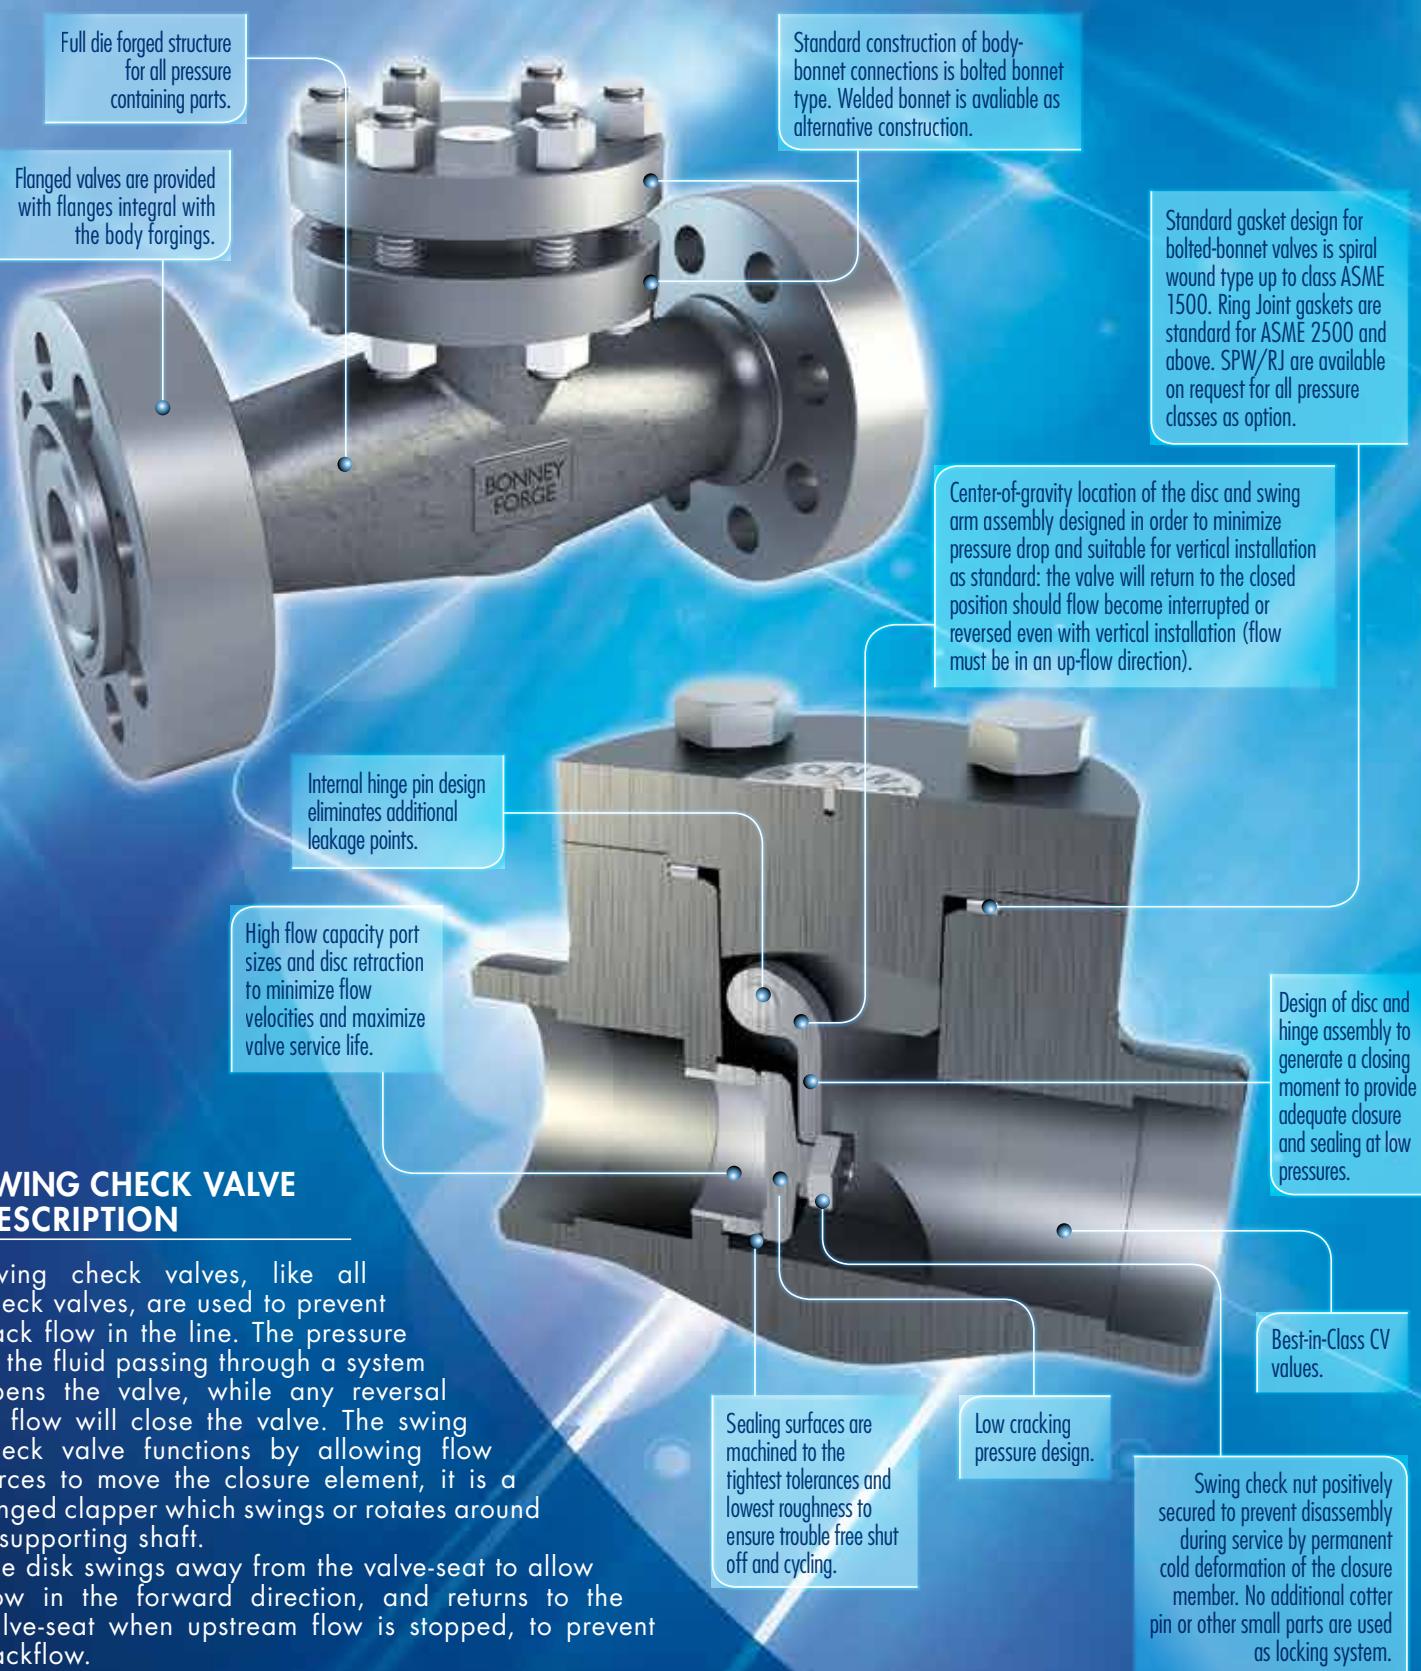

LIVE LOADING

Live Loading System consists of a spring system installed on packing stud to warrant a continuous load on valve packing. Spring are specially designed to allow appropriate load in case of packing settling by minimizing initial load and friction. Mechanical visual indicator of the spring compression is included.

SWING CHECK VALVES

SWING CHECK VALVE DESCRIPTION

Swing check valves, like all check valves, are used to prevent back flow in the line. The pressure of the fluid passing through a system opens the valve, while any reversal of flow will close the valve. The swing check valve functions by allowing flow forces to move the closure element, it is a hinged clapper which swings or rotates around a supporting shaft.

The disk swings away from the valve-seat to allow flow in the forward direction, and returns to the valve-seat when upstream flow is stopped, to prevent backflow.

Swing check design is one of the most common and best check valve for general-purpose use. These valves produce the lowest pressure drop, when compared with other check valves of the same size, the internal contours and shapes allow them to fully open at low fluid velocities and create a smooth flow path through the valve.

The design is simple and easy to maintain and can be used for either horizontal or vertical (fluid flowing upward) pipe layouts. Because of their design, swing checks are not fast-closing valves due to the travel distance from full open to close.

SWING CHECK VALVES

AVAILABLE OPTIONS FOR SWING CHECK VALVES

OTHER VALVE OPTIONS OR CUSTOMISED VERSIONS ARE AVAILABLE ON REQUEST, CONTACT BFE FOR SPECIAL REQUIREMENTS.

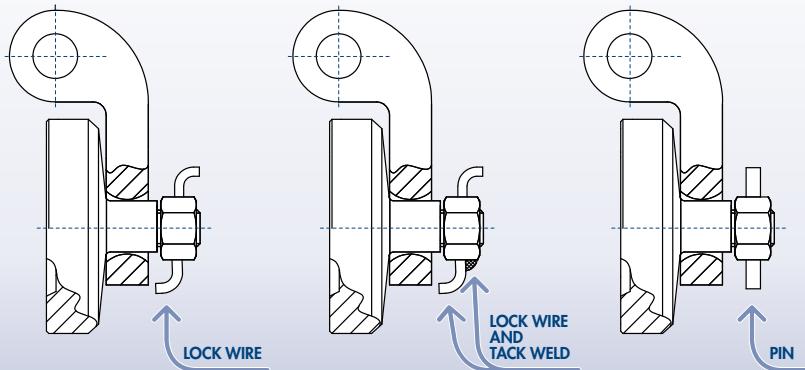

■ TILTING DISC

The tilting-disc swing check is a variant of the swing basic type. In these valves, the disc swings partly through the seat. The disc is opened when flow is present, under no flow conditions it seats against a conical sealing surface. The disc is pivoted just above its center, providing a near balance between the upper and the lower parts of the disc. Tilting disc check valves are designed specifically to minimize the potential for high-energy water hammer damage. Unlike the action of an ordinary swing check valve, the disc is nearly balanced and reaches its seat at the time of zero velocity in the line.

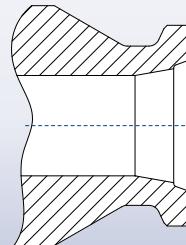

■ ALTERNATIVE CLOSURE MEMBER ANTI-LOOSENING SYSTEM

Swing check design must prevent possible unscrewing of the swing check closure member nut. BFE standard design achieves this goal by cold upsetting of the closure member nut connection. Alternative solutions are available as option, the most common alternative solution is obtained by an additional wire or pin that prevent loosening in service.

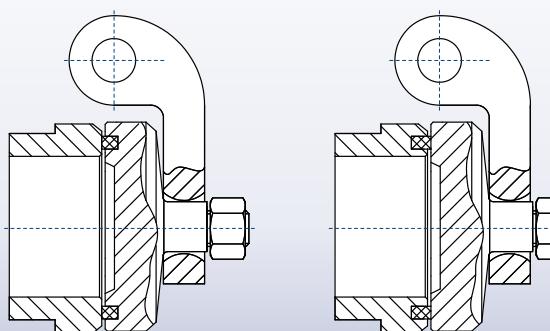

■ SPECIAL END FINISH

The choice of end connections for connecting a valve to its associated pipe is performed by customers. Common end finish stated in the catalogue are socket, threaded, flanged (RF or RJ) and butt-weld ends. BFE is basically able to perform any end finish as per customer request, special end finish Other end finish as follows: hub, compact flange, any ASME B16.5 end finish other than RF and RJ, etc.

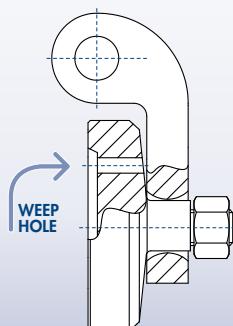

■ SOFT SEATED TRIM

In applications that require positive shut-off such as in chemical and petrochemical services, soft-seated swing check valve is a suitable solution because the use of soft-seat materials imparts excellent sealing ability. Soft seat inserts provide the necessary soft-seating to improve the leakproof design. Soft Insert can be obtained on the seat or on the closure member.

■ WEEP HOLE

The weep hole, is a small opening that allows the fluid to drain from the downstream side to the upstream in case of closed valve. Purpose of weep hole can depend from the application. In case of weep hole option the valve does not achieve leak-tight closing or keep the differential pressure.

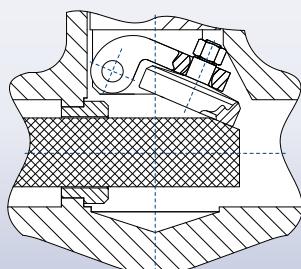

SWING CHECK VALVES

AVAILABLE OPTIONS FOR SWING CHECK VALVES

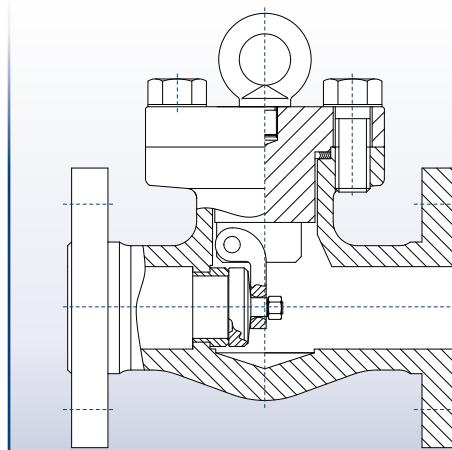

OTHER VALVE OPTIONS OR CUSTOMISED VERSIONS ARE AVAILABLE ON REQUEST, CONTACT BFE FOR SPECIAL REQUIREMENTS.

TIE ROD PACKAGING SET

A tie rod is a slender structural unit used as a tie and (in most applications) capable of carrying tensile loads only. Tie Rod Packaging is used to help protect trim of check valves during shipment. It is common for a transport package to be dropped, kicked, and impacted: These events may produce potentially damaging shocks of the seal surfaces. Shock and vibration are controlled by the tie rod geometry that block the closure member in open position so that the chance of product damage is greatly reduced. The soft insert can be manufactured from elastomer, polymers and similar resilient or semi-resilient materials.

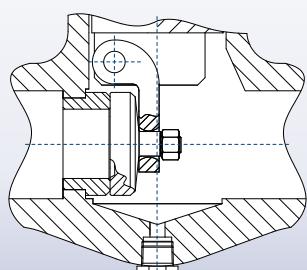

EYEBOLT FOR HANDLING

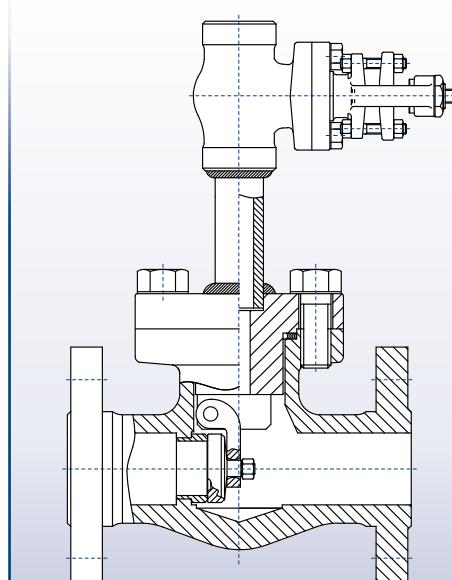

Small size swing check valves does not require lifting eyebolts as standard because of the low weight. Handling is normally performed on small valves by lifting with eye bolts or rods through flange holes. If required the bonnet design can be modified in order to include one screwed lifting eye bolts screwed on the top to facilitate valve installation into the piping system.

AUXILIARY STANDARD DRAIN

Swing check valves can be furnished with drain. Standard drain connections consist of a drilled, tapped, and plugged hole at the ASME B16.34 "G" location. Other types of drains, including welding, or threaded nipples, can also be furnished when specified.

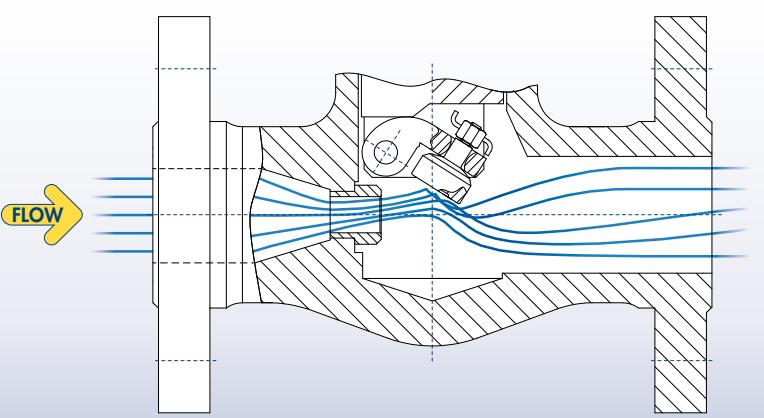

SPECIAL DRAIN OR VENT LINE

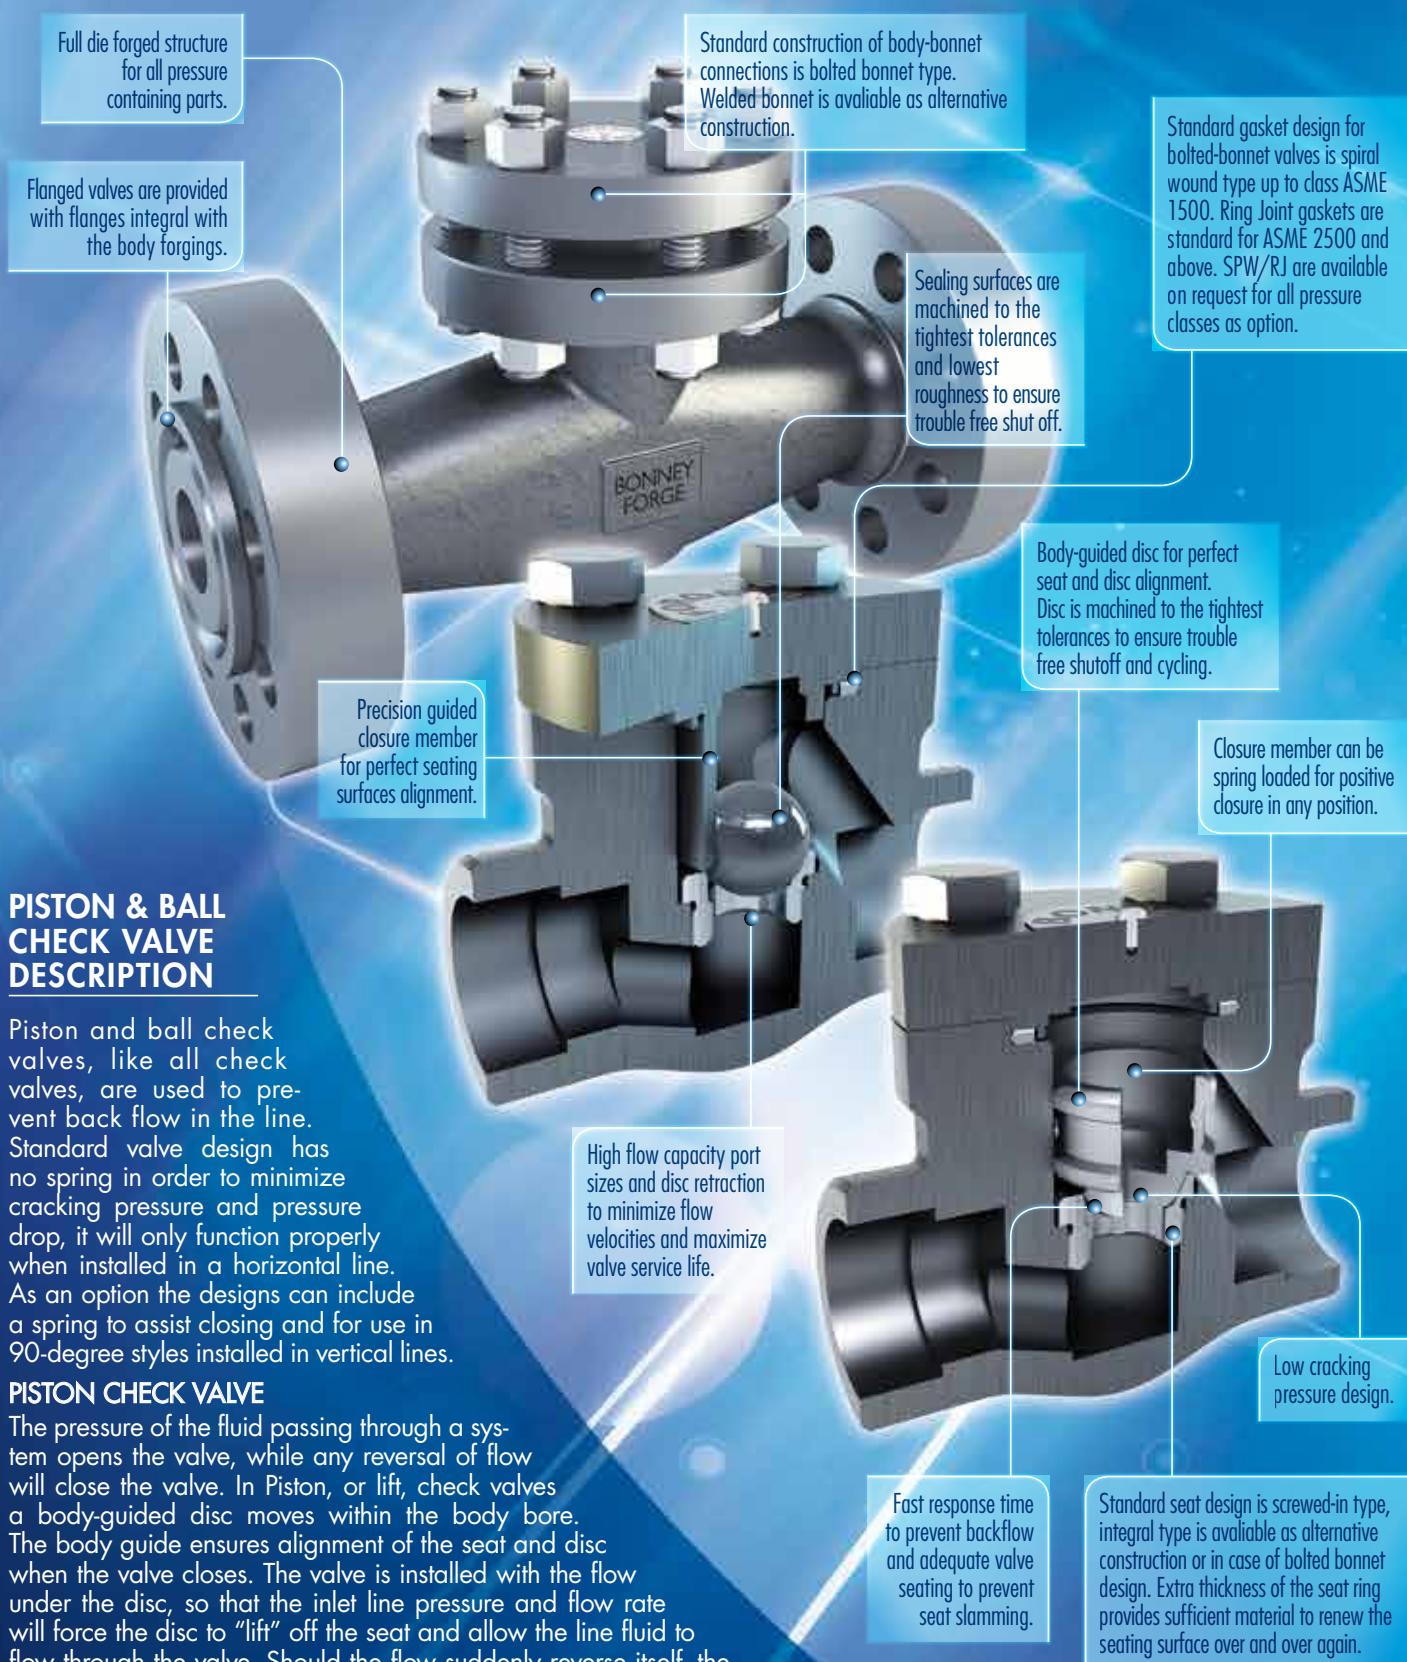

The removal of fluid in pipelines can be a frequent operation for some oil&gas industry applications. The drain/vent line can be added to the swing check design based on the customer requirements. Connections can be provided with permanent block valves, including plugs or blinds.

LOW FLOW RATE NON-RETURN VALVE

Special design and material selection can be performed to eliminate valve chattering. This is a common problem with valves operating in or around the flow-rate and fluid specific mass range the valve is designed to open at. In systems using conventional valves, oscillation caused harmonics in the system create problems related to noise, damage to the valve seats, localized air bubbles etc. Special design based on the flow operating conditions and proper low density material selection eliminate chatter problems.

PISTON & BALL CHECK VALVES

PISTON & BALL CHECK VALVE DESCRIPTION

Piston and ball check valves, like all check valves, are used to prevent back flow in the line. Standard valve design has no spring in order to minimize cracking pressure and pressure drop, it will only function properly when installed in a horizontal line. As an option the designs can include a spring to assist closing and for use in 90-degree styles installed in vertical lines.

PISTON CHECK VALVE

The pressure of the fluid passing through a system opens the valve, while any reversal of flow will close the valve. In Piston, or lift, check valves a body-guided disc moves within the body bore. The body guide ensures alignment of the seat and disc when the valve closes. The valve is installed with the flow under the disc, so that the inlet line pressure and flow rate will force the disc to "lift" off the seat and allow the line fluid to flow through the valve. Should the flow suddenly reverse itself, the disc will automatically and quickly, assisted by the weight of the disc, be forced to the closed position, preventing the line fluid from returning. Exercise caution when these valves are used for dirty media because that media could cause the disc to stick inside the body bore.

BALL CHECK VALVE

The function of ball check valves is similar to the piston check, but the ball check valves use a "ball" inside the body to control the movement of flow. The ball is free to rotate, resulting in even wear and a wiping action between the ball and seat. This feature makes ball checks useful for viscous media.

BFC reserves the right to change designs, dimensions or specifications without notice.

PRODUCT FEATURES:

- Outside Screw and Yoke (OS&Y). • Self aligning two piece packing gland.
- Integral backseat. • Integral body flanges.

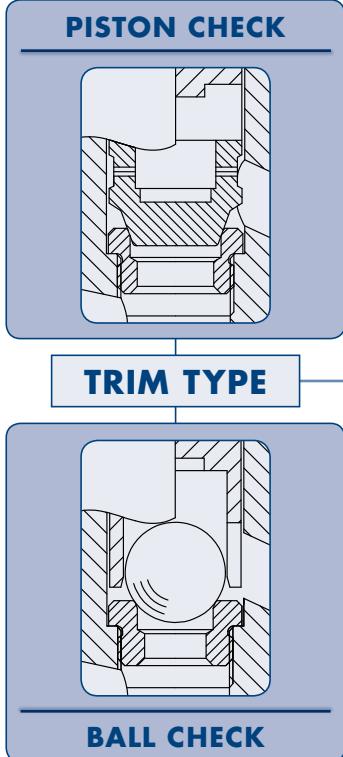

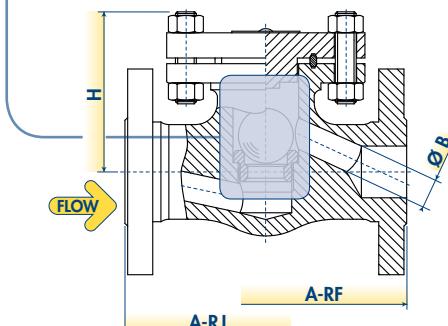

DESIGN TYPE S1

SPIRAL WOUND GASKET BODY-BONNET CONNECTION

PISTON & BALL CHECK VALVES

AVAILABLE OPTIONS FOR PISTON & BALL CHECK VALVES OTHER VALVE OPTIONS OR CUSTOMISED VERSIONS ARE AVAILABLE ON REQUEST, CONTACT BFE FOR SPECIAL REQUIREMENTS.

■ SPRING ASSISTED CHECK VALVES

SPRING ASSISTED PISTON CHECK VALVE

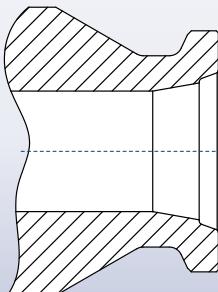

SPRING ASSISTED BALL CHECK VALVE

Standard valves have no spring and depend on the weight of the disc to start closure. These are called "horizontal check valves", as they will only function properly when installed in a horizontal line. Spring loaded check valves may be installed in any position, both in horizontal and vertical piping applications. The spring helps reduce noise, minimize the effect of pulsating flow and "water hammer" line shock and assists the closure member in seating faster.

■ SPECIAL END FINISH

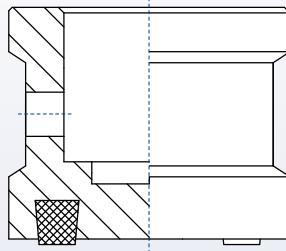

The choice of end connections for connecting a valve to its associated pipe is performed by customers. Common end finish stated in the catalogue are socket, threaded, flanged (RF or RJ) and butt-weld ends. BFE is basically able to perform any end finish as per customer request, special end finish. Other end finish as follows: hub, compact flange, any ASME B16.5 end finish other than RF and RJ, etc.

■ DISC AND TRIM TYPE FOR PISTON CHECK VALVES

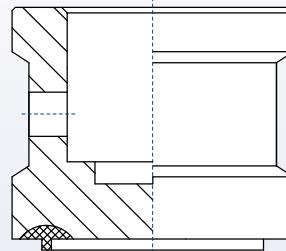

BFE standard plug is the has a quick opening characteristic, this plug provides maximum flow with minimum pressure drop and is ideal when large flows are required just after opening. All BFE standard plugs require a flow direction FTO type. BFE trim variations can offer maximum versatility in flow control application within the capability of piston check valve design.

SOFT SEATED PLUG

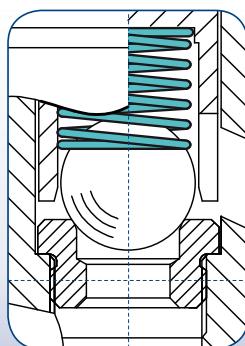

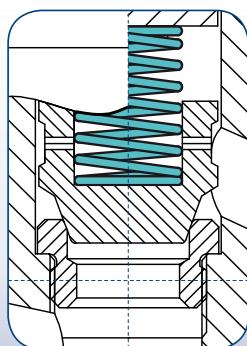

Soft seated trim provides improved seat tightness at low differential pressures. This design feature includes a plastic sealing member on the valve closure element to supplement the basic metal-to-metal seating function. The design and material selection for these sealing members are based on customer pressure, temperature and compatibility with the line fluid.

FLAT SEATED TRIM

Metal to metal flat seated trim provides improved seat tightness with air/gas service. This design feature is required when additional or special test are required (e.g. API 598 air test or high pressure gas test).

■ CUSTOMIZED CRACKING PRESSURE

An important concept in check valves is the cracking pressure which is the minimum upstream pressure at which the valve will operate. Static cracking pressure is the minimum pressure at which fluid is bypassed through the valve at the rate of 0.1cc per minute during conditions of increasing pressure supplied by means of a hand pump. Valve cracking pressure can be customized to meet unique performance requirements through the modification of the trim design (closure member geometry, spring force and materials).

PISTON & BALL CHECK VALVES

AVAILABLE OPTIONS FOR PISTON & BALL CHECK VALVES

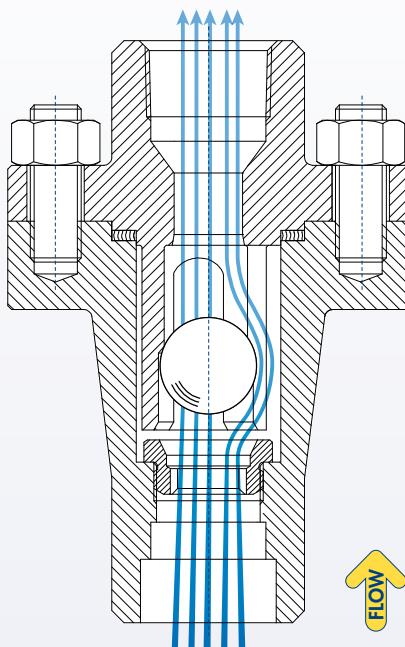

OTHER VALVE OPTIONS OR CUSTOMISED VERSIONS ARE AVAILABLE ON REQUEST, CONTACT BFE FOR SPECIAL REQUIREMENTS.

IN-LINE VERTICAL CHECK VALVES

In-line check valves prevent reverse flow with disc movement that is parallel with the flow. With this design, the disc is always in the flow path. Closure member can be spring-loaded to assist in seating. The in-line check valve disc has very short disc travel and responds very quickly to flow stoppage or reversal, thus minimizing the potential for water hammer. The in-line check valve produces the most pressure drop when compared to other check valves of the same size.

ALTERNATIVE DESIGN SOLUTIONS

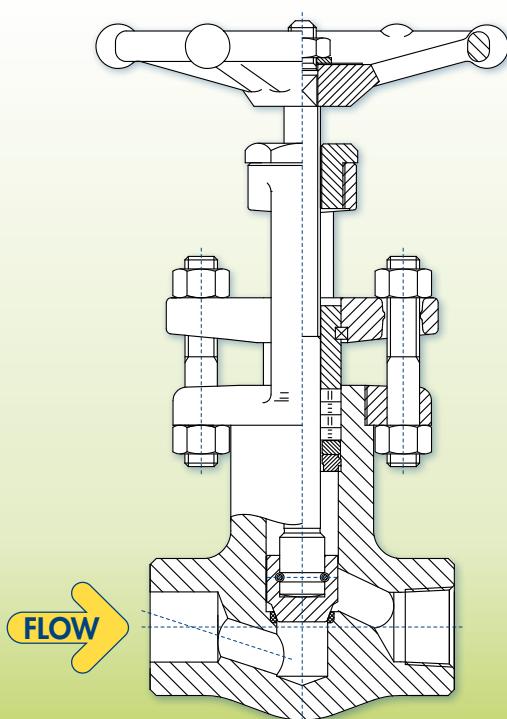

There are a large variety of available valves and valve configurations for a wide variety of purposes and conditions not tabulated in this catalogue. Some example are listed below. Other valve designs or customised configurations are available on request, contact bfe for special requirements.

ANGLE PATTERN GLOBE VALVES

The Angle pattern globe valve is a modified version of "T"-Pattern Globe valve with inlet and outlet at right angles. When fitted at a change in piping direction, this valve eliminates a bend and has the advantage of smaller pressure drop than a conventional "T" pattern globe valve. Angle valves have the same features of stem, disc and seat ring design as the globe valve. The fundamental difference between the two is that the fluid flow through the angle valve makes a 90° turn. These valves offer less resistance to flow than a globe valve with an elbow which it would replace. An angle valve reduces the number joints in a line, in addition to saving installation time. They are also used in applications that have periods of pulsating flow because of their capability to handle the slugging effect of this type of flow.

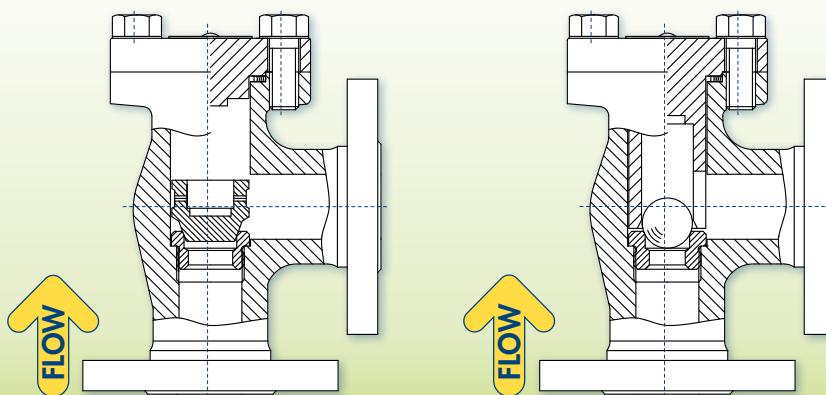

BONNET LESS VALVES

Bonnet less valves have no bonnet under pressure, the only pressure containing part of the valve is the body. This feature removes the need for a separate bonnet and eliminates any gasket leakage, any bolted connection in case of bolted bonnet design and any welds in case welded bonnet designs. Instead of the bonnet there is the yoke with structural functions only, this design allows in-line repair or inspection to be carried out more easily and at less cost than any other valve. Stem, disc, and packing can be quickly removed and the seat fully exposed for "like new" restoration.

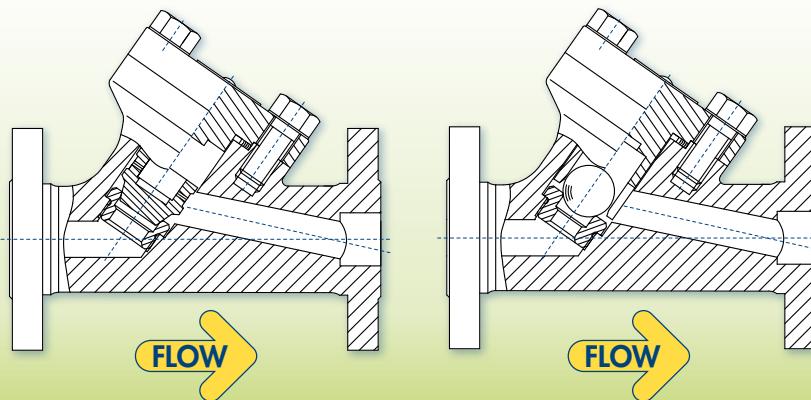

ALTERNATIVE DESIGN SOLUTIONS

ANGLE PATTERN PISTON & BALL CHECK VALVES

The Angle pattern check valve is a modified version of a standard check valve with inlet and outlet at right angles. When fitted at a change in piping direction, this valve eliminates a bend and has the advantage of smaller pressure drop than a conventional check valve.

"Y" PATTERN PISTON & BALL CHECK VALVES

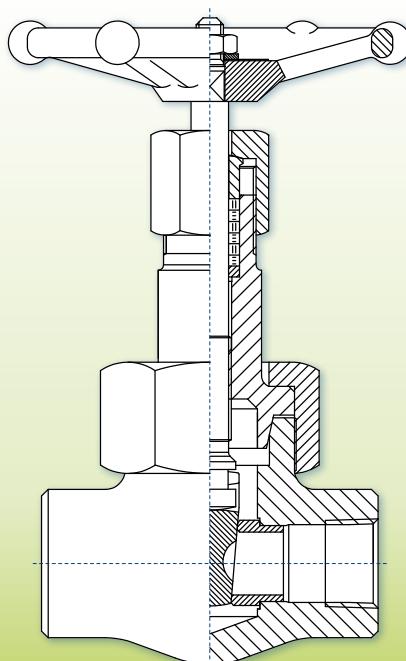

The "Y"-Pattern check valve is a modified version of a standard check valve.

The body design selected will determine the pressure drop; inclined designs will provide the best flow performance.

"Y"-Pattern check Valves are generally used to protect pumps or similar equipment, allowing the flow in only one direction and preventing flow reversal due to back pressure with the best possible effort for laminar flow and increased CV.

UNION BONNET VALVES

Union bonnet is the market standard design for bronze valves up to 2" size.

A type of valve construction in which the bonnet is held on by a union nut with threads on the body.

The nut is optimum sized hexagon shaped with high tensile properties to provide a leak-tight joint for maximum security under pressure.

A union bonnet is appropriate for appliances that require regular inspection and maintenance and offers added reliability.

Designed for rugged service applications, with maximum resistance to distortion produced by internal pressure.

GENERAL SALE CONDITIONS

QUOTATION VALIDITY

Unless otherwise agreed, quotations are valid for four weeks from date of issue.
The delivery terms are always "ex-works" unless otherwise stated.
Prices and sale conditions can be changed without any previous notice.

ORDERS ACCEPTANCE

Orders are considered accepted at our general sale conditions clearly mentioned on order acknowledgment.

GOODS DELIVERY

The Company does not accept any responsibility for delays in delivery which are always intended as indicative and not binding. Transport risks are at receiver's charge also in case of CIF delivery.

GUARANTEE

The Company guarantees all its products, from material and/or manufacturing defects, to be used as recommended by standards, and in accordance with approved piping practice and technique, for a period of one year from shipping date, unless otherwise agreed.

The Company liability covers eventual "free of charge" replacements for defective parts or products, providing it has not failed in the observance of above mentioned conditions and in use in compliance with standards, and, anyway, after return of defective goods. Any other liability, neither objective nor subjective will be accepted.

CLAIMS AND ORDER CANCELLATIONS

Claims will be considered only if made within 10 days from goods receipt.
Partial or complete cancellations of order can be accepted only upon previous agreement or by written consent and, however, not later than 15 days from order date.
Any controversy will be handled by the Court of Milan.

The material in this catalog is for general information.
For specific performance data and proper product selection, consult BFE
or your BFE representative. BFE reserves the right to change designs,
dimensions or specifications without notice.
